CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., JANUARY, 1921. No. 1

GENERAL SUMMARY.

Extended periods of unseasonable warmth and the absence of any severe temperatures were the special features of the month's weather. Mean temperatures ranging from 4° to 24° above normal were recorded in most of the State during the first decade, from the 19th to 25th, and 28th to 30th. The persistence of spring-like weather caused wheat to begin growing and trees to show indications of budding. The tendency toward growth was checked by the short intervening periods with average temperature a few degrees below normal and minimum temperatures below freezing. Alternate freezing and thawing on a few days near the middle of the month injured wheat to some extent; but in general this crop fared much better than usual in January, and seemed to improve in the southern counties. There was considerable snow protection during the periods 13-15th and 25-27th; and, except on a few days, the lack of snow covering at other times was of little importance because of the moderate temperature.

Rainfall averaged considerably less than normal, some stations reporting only about half the normal amount. It was well distributed through the month, occurring in light to moderate showers and light snowfalls. This precipitation feature was quite important, for the soil needed all the moisture received, on account of the shortage during previous months. There was but little run-off, streams showing practically none of the usual winter fluctuations. Although relatively light in quantity, the frequency of precipitation kept the surface soil wet and prevented much progress with plowing; otherwise conditions were generally favorable for outdoor work. The sleet and ice storm of the 25th caused some damage to trees, and also necessitated increased feeding of stock for a few days.

TEMPERATURE.

The average temperature for the State, 38 stations reporting, was 39.7°, which is 4.5° above normal. Maximum temperatures of 60° or higher, and minimum temperatures above freezing, were registered frequently at most stations in the periods 1st-8th and 20-24th. There were a few days when minimum temperatures ranged between 15° and 20°, but generally they registered only a few degrees below freezing in the cold periods. The extremes for the month were 71° at Beattyville on the 4th, and 12° at Anchorage on the 27th.

PRECIPITATION.

The average precipitation, based on reports from 55 stations, was 3.06 inches, which is 1.33 inches less than normal. Precipitation occurred generally over the State in the periods 1st-2d; 7-8th; 11-15th; 25-26th, and 29th-31st; and in most districts from the 21st to 23d. From one to four inches of snow occurred in the northern and central counties on the 13th-14th, and one to two inches of sleet or snow in the central and southern counties on the 25-26th. The total snowfall for the month ranged between four and ten inches in the east-central counties, and from two to four inches in most other districts. The monthly precipitation ranged between four and five inches in the upper valleys of the Green and Cumberland, and from 2.0 to 3.5 inches in the rest of the State. Amounts at the various stations ranged between 2.00 inches at Carrollton and 4.81 inches at Brownsville. Thunderstorms were reported on the 1st and 29th.

MISCELLANEOUS.

January 25.—Sleet and ice on streets and sidewalks in Louisville caused many accidents, resulting in the death of one person and injuries to several others.

Rivers.—Moderate stages prevailed in the Ohio River, with no important changes. Its tributaries in the state remained at low stages.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b] represents two days, etc.
† Also on other dates. †† Received too late to be included in means and summaries.
T Precipitation is less than 0.01 inch rain or melted snow.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland, (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Precipitation for 24 hours ending at 3 p. m.

BINDING DEPT. NOV 4

Daily Temperatures for January, 1921.

UNIVERSITY OF ILLINOIS LIBRARY

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., FEBRUARY, 1921. No. 2

GENERAL SUMMARY.

Unseasonably warm weather prevailed from the 3d to 17th, mean daily temperatures ranging from 10° to 28° above normal on many days during this period. Wheat and grass made considerable growth; blossoms appeared on maple trees and some early plants; plum and peach buds advanced to such a stage of development as to alarm fruit growers; and vegetation generally seemed to indicate that spring was at hand. Growth was checked by a change to colder on the 18th, followed by heavy snow on the 19-20th, with temperatures below normal on most days during the remainder of the month. This period of cold weather was undoubtedly of great benefit in stopping the untimely plant development, particularly in preventing the premature blossoming of fruit trees. On account of the fact that wheat had been sown late in order to avoid fly damage, it had not advanced to a stage where freezing weather would cause serious injury; nevertheless this cold spell was beneficial in retarding its growth and returning it to the dormant condition. Several hard freezes occurred in the period, 18th-21st, but winter grains were protected by snow on the 20th and 21st. Freezes in the period 23d-25th came without much snow covering, but seem to have caused little damage to wheat because of its vigorous condition. Some plowing and sowing oats was accomplished in the southern counties during the first week, but the soil was generally too wet to be worked during the remainder of the month.

Precipitation averaged only slightly less than the normal amount, and was well distributed through the month. A large part of the rainfall and most of the water from the melting snow was absorbed by the soil, overcoming the long continued deficiency in sub-soil moisture.

TEMPERATURE.

The average temperature for the month, 38 stations reporting, was 41.3°, which is 5.7° above normal. Minimum temperatures a few degrees below freezing were registered from the 1st to 4th, and ranging between 11° and 25° in the period 18-25th. Maximum temperatures ranging from 50° to 70° occurred generally from the 6th to 17th. Extremes at the various stations were 77° at Princeton and Hopkinsville on the 14th; and 11° at Taylorsville on the 21st, and at Calhoun and Owensboro on the 25th.

PRECIPITATION.

The average precipitation, based on reports from 57 stations, was 3.20 inches, which is 0.40 inches below normal. There were few days on which precipitation did not occur in some part of the State. The principal periods were: 5-12th, moderate to heavy rains; 19-20th, heavy snow; and 23d-27th, light scattered showers. Precipitation was heaviest in the extreme western counties, ranging between 4.0 and 5.0 inches; and lightest in the northeastern counties where it ranged from 2.2 to 3.0 inches. The remainder of the State received 3.0 to 4.0 inches. Snowfall averaged 8.9 inches, nearly all of it occurring in one storm on the 19-20th. In a broad belt from east to west across the State the depth ranged from 10 to 14 inches, diminishing to the northward and southward of this district. Precipitation amounts at the various stations varied between 1.83 inches at Cloverport and 5.20 inches at Brownsville.

MISCELLANEOUS.

Rivers.—A rise to moderate stages, caused by rain and melting snow in the upper basin, occurred in the Ohio River from the 8th to 14th. Green River was near flood stage in the upper reaches on the 12th, and in the lower section from the 14th to 16th; but other tributary streams in this State showed no changes of special importance.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing: for example, b represents two days, etc.
† Also on other dates. ‡‡ Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
¶ Post office address, Covington, Ky.

Daily Precipitation for February, 1921.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. *Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

*Precipitation for 24 hours ending at 3 p. m

Daily Temperatures for February, 1921.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., MARCH, 1921. No. 3

GENERAL SUMMARY.

The mean temperature for the month was the highest on record in this State for March. Unseasonably warm weather prevailed almost continuously from the 1st to the 27th, the daily excess during most of this period ranging from 10° to 27°. The persistence of high temperature caused premature development or forcing of early vegetation, which reached the stage of rapid growth and marked susceptibility to frost damage about three weeks ahead of the usual time. Wheat, clover, pastures, and fruit trees presented the appearance usually seen about the middle of April. Peach, pear, and plum trees began to bloom in the northern counties about the 13th, and in the southern counties a week earlier; and were in full bloom by the end of the third week. Wheat grew rapidly and had begun to joint in some of the earlier fields in the southern counties. A sharp cold wave swept over the State on the 28th, accompanied by a severe freeze on the 29th, with minimum temperatures ranging from 19° in the northern to 30° in the southern and eastern counties. Most of the fruit in blossom was killed, the damage to plums, pears and peaches being especially heavy; while apples, cherries and grapes were considerably injured. Clover was also damaged to some extent, but wheat generally escaped injury of consequence.

Precipitation was heavy in the agricultural districts, being nearly twice the normal amount in many localities; but was generally deficient over the mountain counties. Good progress was made with plowing during the third week, otherwise the frequent and heavy rains rendered the month unfavorable for soil preparation.

TEMPERATURE.

The average temperature for the month, 41 stations reporting, was 56.7°, which is 10.7° above normal. Maximum temperatures ranging from 70° to 85° occurred almost daily in the period 5-27th. Minimum temperatures were also unseasonably high until the 28th, the only cold period of importance being the 28-30th. On the 29th minimum temperatures ranging from 19° to 25° were registered in most localities. These temperatures were not unusual for the last of March, but were especially damaging this year on account of the advanced condition of vegetation. The extremes at the various stations were 87° at Bardstown on the 15th and at Greenville on the 20th, and 19° at Shelbyville on the 29th.

PRECIPITATION.

The average precipitation, based on reports from 58 stations, was 5.75 inches, which is 1.09 inches in excess of normal. Precipitation was frequent and unevenly distributed over the State. The principal periods were: 2d-3d, moderate to heavy rains; 6-7th, showers; 8-9th, heavy rains; 12-16th, showers; 22d-24th, moderate to heavy rains; 27-28th, heavy rains; and 31st, moderate to heavy rains. In the northern, central and western counties monthly amounts ranged between 5.0 and 9.0 inches; while in the upper Cumberland basin and the mountain district they ranged between 2.5 and 4.0 inches. The only snowfall was a trace in the northern counties. Amounts at the various stations ranged between 2.59 inches at Pikeville and 9.12 inches at Shelbyville. Thunderstorms were frequent in the central and western counties and accompanied in a few instances by damaging hail.

MISCELLANEOUS

March 5.—A barn was burned by lightning near Whitewood, Green County.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.
T. Precipitation is less than 0.01 inch rain or melted snow.
[a] Also on other dates. ** Received too late to be included in means and summaries.
¶ Postoffice address, Covington, Ky.

March 15.—Greenhouses and windows in residences and business houses at Paducah were damaged by a heavy hailstorm. Automobile tops were punctured by the hail. The loss is estimated at $100,000.

March 24.—A windstorm, probably a tornado, having a path about three-fourths of a mile wide and extending due north, caused damage estimated at $50,000 in Scott County. Nine barns were destroyed, several head of cattle and horses killed, and residences and telephone systems damaged. Heavy hail that accompanied the storm caused damage to fruit trees.

Five persons were injured and considerable property damaged in a windstorm in Madison County. Hail causing slight damage occurred in Jefferson and Fayette counties.

Daily Precipitation for March, 1921.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Precipitation for 24 hours ending at 3 p. m

Rivers.—A rise began in the upper reaches of the Ohio on the 3d, soon reaching moderate stages which continued until about the 13th. This swell, together with the runout of the tributaries, in the lower basin, caused flood stages in the lower Ohio for the first time this season. The river at Paducah and Henderson reached flood stage on the 12th and continued above that stage until the 17th. Flood stage was also reached at Mt. Vernon, Ind. on the 15th. Considerable freshets occurred in Green River on the 11-12th and 30th, but flood stage was not reached.

Daily Temperatures for March, 1921.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., APRIL, 1921. No. 4

GENERAL SUMMARY.

Although the temperature averaged above normal and precipitation near normal, the month was decidedly unfavorable for farm work and for growth of vegetation. Frequent periods of cold weather, with heavy frosts and freezes, checked plant growth and caused further damage to fruit; while rains at short intervals prevented seasonal progress with soil preparation and spring planting. The month began with temperature near freezing, followed by several days of warm weather that caused the later fruit blossoms to open. A severe freeze on the 11th practically completed the destruction of the early fruit and caused some injury to the earliest wheat, which was jointing at this time. Killing frosts and freezing temperature, the last of the season, also occurred in the period 17-19th, damaging wheat and strawberries. Temperatures were favorable during the last decade, but frequent rains interfered with outdoor work and little progress was made with plowing and planting corn. The cold, wet weather retarded the growth of wheat, and promoted the formation of rust in some localities; but the vigorous condition of this crop at the beginning of April carried it through the unfavorable weather without serious damage, and the crop was still ahead of the season at the end of the month. Much difficulty was experienced in sowing oats and planting potatoes because of wet soil, some of this work being delayed from two to three weeks. Potatoes were slow in coming up, and suffered only slight damage from frost. Conditions were especially unfavorable for gardening. Early vegetables that grow at moderately low temperatures matured fairly well, but the principal garden plants that require more warmth for their development showed poor stands and made little progress. Pastures and meadows continued in luxuriant condition.

TEMPERATURE.

The temperature for the month, 42 stations reporting, averaged 58.2°, which is 2.3° above normal. Minimum temperatures near freezing were registered in the periods 1st-2d; 10-12th; 17-19th; and 30th. On the 11th they ranged from 22° to 31°, and on the 18th from 27° to 34° generally over the State. Maximum temperatures of 80° or above occurred in the periods 4-7th, 15th, and 23d-26th. The highest for the month was 90° at Ages, Harlan County on the 26th and at Beattyville on the 25th; and the lowest 22° at Shelbyville on the 11th.

PRECIPITATION.

The average precipitation, based on the reports of 58 stations, was 4.09 inches, which is 0.15 inch above normal. The distribution over the State was quite uniform. In general, precipitation was heaviest in the northern and extreme western counties, ranging from four to five inches; and lightest in the south-central and eastern district, where it ranged from three to four inches. Moderate to heavy rains occurred in the periods 7-9th and 14-17th, and showers in the periods 21st-22d, and 26-29th. After the 7th there were only two days without measurable precipitation in some part of the State. Amounts at the various stations ranged between 2.21 inches at Richmond and 5.59 inches at Bowling Green. Snow flurries occurred on the 10th and 17th. Thunderstorms were reported on the 8th, 9th, 15th, 16th, 22d, 25th, and 26th. They were attended by hail in some localities on the 9th, 16th, and 26th.

MISCELLANEOUS

April 8.—Hail caused some damage to fruit blossoms and early crops in Jefferson County.

April 26.—A windstorm caused damage estimated at $20,000 to buildings at Smithland, and hail accompanying this storm damaged crops in Livingston County. A severe storm of wind

(Continued on next page.)

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [a], [b], etc., appearing in the table indicate number of days missing; for example, b represents two days, etc.
† Also on other dates. [a] Received too late to be included in means and summaries.
T. Precipitation is less than 0.01 inch rain or melted snow.
* Post office address, Covington, Ky.

and hail damaged buildings, wire systems, fences, trees, and tobacco plantbeds in Barren, Cumberland and Monroe counties. A barn was partly destroyed by lightning near Georgetown.

Rivers.—The Ohio River approached the flood stage at Evansville near the beginning of the month, but it soon declined to moderate stages that continued until the end of the month. Green River was near flood stage at Woodbury on the 3d and at Rumsey on the 4th, and was also moderately high on the 19th and 20th.

Daily Precipitation for April, 1921.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., MAY, 1921. No. 5

GENERAL SUMMARY.

Weather conditions during the first half of the month contrasted strikingly with those prevailing during the last half. Cloudy, showery weather was the rule during the first two weeks, and temperatures were below normal almost daily until the 17th. Conditions were decidedly unfavorable for outdoor work, wet soil preventing much progress with plowing and corn planting. Corn germinated poorly, producing an uneven stand, and much of it was planted over later in the month. The growth of wheat was checked somewhat, and rust appeared in a few localities; but on account of the advanced condition of this crop it continued to develop ahead of the season. Gardens were exceptionally backward, and the growth of tobacco plants was retarded by the low temperature. During the last two weeks fair weather and unseasonably high temperature prevailed, being the first period of favorable weather for outdoor work since March. Excellent progress was made with preparation of soil and other farm work, especially corn planting, which was nearly completed. This period of high temperature, by stimulating corn to quick germination and rapid growth, compensated in a measure for the delay in planting. Some tobacco was transplanted where local showers occurred in the central and eastern counties during the last week. In large districts, however, including most of the western counties, the moisture was not sufficient for tobacco setting. The high temperature hastened the maturity of wheat, which showed indications of premature ripening in the dry districts. Early potatoes also matured too rapidly, the straw of oats was shortened, and the strawberry crop was considerably reduced. Toward the end of the month the soil became dry and hard, causing preparation and planting to proceed with difficulty.

TEMPERATURE.

The temperature for the month, 41 stations reporting, averaged 65.9°, which is 0.3° above normal. Minimum temperatures near freezing occurred generally on the 1st, and only a few degrees above freezing at many stations on the 2d, 3d, 6th, and 7th. A sharp change to warmer occurred on the 18th, daily maxima during the last two weeks ranging from 85° to 95°. Mean daily temperatures during this period ranged generally from 5° to 13° above normal. The highest for the month was 97° at Shelbyville on the 24th and at Glasgow on the 28th; and the lowest 32° at Middlesboro on the 1st.

PRECIPITATION.

The average precipitation, based on the reports of 58 stations, was 2.45 inches, which is 1.50 inches less than normal. Rainfall was heaviest in the eastern mountain region, being in excess of five inches in the Big Sandy Valley. It decreased rapidly toward the west and southwest, the average amount over the agricultural portion of the State being only about half of the normal rainfall for May. In large areas, principally the south-central and southwestern counties, the Licking Valley and Blue Grass Region, and the southeast corner of the State, amounts ranged between one and two inches. Showers occurred in the period 1st-6th, and moderate to heavy rains from the 10th to 12th, showers continuing until the 14th. Moderate to heavy local showers also occurred from the 25th to 29th, mostly in the central and eastern counties. Amounts at the various stations ranged between 1.12 inches at Woodbury and 5.81 inches at Lounsa. Thunderstorms were frequent in the periods 10-13th and 25-28th, attended by hail on the 13th, 25th and 28th.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [a], [b], appearing in the table indicate number of days missing; for example, b represents two days, etc.
† Also on other dates. ‡ Received too late to be included in means and summaries.
T Precipitation is less than 0.01 inch rain or melted snow.
¶Post-office address, Covington, Ky.

MISCELLANEOUS.

May 12.—Near Amos, Allen County, two men were killed by lightning and another probably fatally injured while standing under a tree. In Mason County a boy was killed by lightning while riding on a horse with another boy, the horse and other boy escaping injury.

May 26.—At Louisville lightning exploded fumes of industrial alcohol causing damage estimated at $1,500.

May 29.—A farmer was killed by lightning near Harrodsburg.

Auroras.—An auroral display began faintly on the night of the 13th, becoming brilliant on the night of the 14th and 15th, and continuing with decreasing brilliancy until the night of the 17th. The length of this display, its intensity and magnitude, which practically included the entire sky on the night of the 14th, were remarkable and probably unprecedented in this

(Continued on next page.)

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Precipitation for 24 hours ending at 3 p. m

ocality. Earth currents as strong as 170 volts were reported by telegraph companies at Louisville on the night of the 14th. These are said to be the strongest currents of this character ever recorded in this vicinity. Interference with telegraph wires continued periodically from the 13th to 16th, inclusive, the time of greatest disturbance coinciding with the brilliant display on the 14th. The aurora was seen all over the State.

Rivers.—Good stages prevailed in the Ohio during the first half of the month, but they declined to pool stages in the third week. Rains over the upper basin on the 25th started a rise that gave moderate stages during the last week. Other streams of the State were generally low.

Daily Temperatures for May, 1921.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., JUNE, 1921. No. 6

GENERAL SUMMARY.

The most noteworthy features of the month's weather were the persistent high temperature and the local character of the rainfall. Except in 1890 and 1914, the average temperature was the highest for June since State records were established in 1889. Temperatures were slightly below normal in the period 5-7th, otherwise daily averages were constantly above normal, the excess ranging from 5° to 10° on most days. The high temperature, especially the warm nights, greatly stimulated the growth of corn, advancing its development to a condition practically abreast of the season, and overcoming much of the delay due to late planting. The hot, dry weather also hastened the maturity and ripening of wheat; but it was responsible for the failure of many heads to fill and for yields considerably lighter than expected. The crop was harvested earlier than usual, the grain dried out quicky, and thrashing followed at once because of favorable weather conditions.

Precipitation consisted entirely of local showers, and in consequence was unevenly distributed, some restricted areas receiving about the normal amount; while over large districts it was so light that drought conditions had become established in such places by the end of the month. The drier portion of the State was mainly in two belts, one of which extended across the west-central and the other across the eastern counties from southwest to northeast. In the burley district rainfall was generally sufficient for transplanting tobacco, although much of the crop was set late; but in the dark district dry weather prevented the setting of a full crop. On smooth land, where machines are now largely used in setting, the dry weather was favorable for the work. Early potatoes were badly damaged and made one of the shortest crops in many years, being almost a failure in many localities. The straw of oats was shortened, meadows matured prematurely, and much young clover died. Alfalfa and clover were cut and cured under excellent conditions, but the drought and heat were unfavorable for starting the second crop. Except for the dryness of the soil, the weather was favorable for the cultivation of corn and tobacco, which were kept unusually clean. Pastures deteriorated and gardens made poor progress.

TEMPERATURE.

The temperature for the month, 42 stations reporting, averaged 77.8°, which is 4.1° above normal. Except in the period 5-7th, minimum temperatures near 70° were registered on most days; while maximum temperatures of 90° or above were recorded practically every day. Uniformity of temperature was a marked characteristic. The highest for the month was 100° at Mayfield on the 30th, and the lowest 46° at Scott and Shelbyville on the 5th.

PRECIPITATION.

The average precipitation, based on the reports of 57 stations, was 2.90 inches, which is 1.28 inches less than the normal June rainfall. In the lower Licking basin, along the middle course of the Kentucky, and in a few other localities, the monthly amount was near normal. In the eastern counties, and in southwest-northeast belts extending from the upper Green to the lower Licking, and from the southwest corner of the State to the lower Green, amounts ranged between 3.0 and 4.5 inches. In parallel belts extending from the upper Cumberland to Mason County, and from Logan to Oldham County, amounts ranged between 0.8 inch and 2.5 inches; being generally about half the

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Received too late to be included in means and summaries.
† Post-office address, Covington, Ky.
T Precipitation is less than 0.01 inch rain or melted snow.

normal rainfall. The dry district in the west-central counties coincided in part with the dry district in May preceding. There were no well defined rain periods. After the 7th local showers occurred somewhere in the State every day, but were most general in the periods 8-12th, 19th-22d, and 28-30th. Amounts at the various stations ranged between 0.78 inch at Earlington and 5.35 inches at Falmouth. Local thunderstorms were frequent, and attended by some loss of life and damage to property.

MISCELLANEOUS

June 16.—Three oil tanks were burned by lightning near Smith's Grove, Warren County.

June 21.—A soldier was killed and two others seriously injured by a bolt of lightning that struck the athletic field at Camp Knox.

Daily Precipitation for June, 1921.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

§ Precipitation for 24 hours ending at 8 p. m.

June 27.—Five heat prostrations occurred at Louisville.

June 30.—A man was killed by lightning near Eubank, while using on a hay-rake.

Rivers.—The streams of the State, including the Ohio, were unusually low during the month. Navigation was impeded by low water in the Ohio between Louisville and Evansville.

Daily Temperatures for June, 1921.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

OL. XXVI. LOUISVILLE, KY., JULY, 1921. No. 7

GENERAL SUMMARY.

Weather conditions were similar to those that prevailed in ne preceding, but were more intensified as to heat and ought. All early crops were seriously damaged, oats, early rn, young clover and gardens probably faring the worst. stures dried up and farmers were compelled to feed their ck. Drought became apparent in large areas in the central d western counties during the first week, spreading as the nth advanced to include most of the State. Early corn on od soil held out fairly well until about the middle of the nth, after which it deteriorated rapidly because of "firing", mature appearance and drying of tassels, and failure to ferti- e and form ears. Early tobacco "fired" badly and grew wly, making no progress of consequence during the last three cks. Much of the late planting died in the fields during the st two weeks. Except in a few favored localities, where local ns were more frequent, the tobacco crop presented the poorest pearance in many years. Oats were almost a failure and re generally cut for hay. The dry, hot weather caused delay planting late potatoes; also considerable loss of seed where y were planted without sufficient moisture. Gardens practi- ly ceased to produce, and vegetables became scarce. Con- derable inconvenience was experienced from failure of stock ter in the hilly districts.

Precipitation was local and generally in the form of light to derate showers that had little effect on vegetation. Even ere heavy showers occurred the dry soil was not penetrated pply, and the moisture was lost quickly because of the intense t and rapid evaporation. To a considerable extent the trict in which the drought was most severe coincided with area of lightest precipitation in May and June preceding, eral stations reporting a total rainfall of 4.00 to 6.00 inches the three months, May to July, inclusive.

TEMPERATURE.

The temperature for the month, 40 stations reporting, averaged .1°, which is 4.4° above normal; and exceeded only during past 33 years by the average of 81.7° in July, 1901. Max- um temperatures of 100° or higher were registered on five to rteen days, and 90° or above on nearly every day, at stations the central and western counties. Record mean temperatures July were established at stations representing all divisions the State, exceeding those recorded in 1901, 1913, and 1914, en similar conditions prevailed. A few days with normal mperature in the period 20th-22d, afforded the only relief m the excessive heat. The extremes for the month were 6° on the 3d at Hopkinsville, and 52° on the 22d at Jackson.

PRECIPITATION.

The average precipitation, based on the records of 55 stations, s 2.65 inches, which is 1.65 inches less than normal. The tal deficiency for this month and June preceding was nearly 50 inches, and at many stations in the drier districts it was re than half of the normal precipitation for these two months. rer the southeastern mountain region, in a limited area about e mouth of the Licking, and in a few other localities, monthly nounts ranged from 4.00 to 6.00 inches. In the remainder the State, including most of the cultivated district, amounts nged from about 1.00 to 3.00 inches; while considerable areas in the north-central counties and the western part of the State received less than 1.00 inch. Scattered showers occurred almost daily from the 1st to 16th and from the 24th to 28th. Showers, varying greatly in amount, occurred quite generally in the periods 19-20th, and 29th-31st. Practically all precipitation occurred in connection with thunderstorms, which were frequent and attended by considerable damage and a number of fatalities.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining the averages of division means.
Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, 5 represents two days, etc.
: Also on other dates. *a* Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
* Postoffice address, Covington, Ky.

MISCELLANEOUS

July 5.—During a heavy local storm at Owensboro, a theater was unroofed and practically ruined, a building was damaged by lightning, much plate glass was broken and wire systems extensively damaged.

July 13.—A woman was killed by lightning near Paris.

July 14.—A residence and church were damaged by lightning at Jackson.

July 18.—A girl was killed by lightning at Prestonburg.

July 19.—Fifty head of cattle were drowned and several bridges swept away along Otter Creek, Madison County, due to a heavy local rain.

Daily Precipitation for July, 1921.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning: amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

; Separate dates of falls not recorded. T Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy, (L) Licking, (K) Kentucky, (S) Salt, (G) Green, (C) Cumberland, (T) Tennessee, (O) Ohio, (M) Mississippi.

* Precipitation for 24 hours ending at 3 a. m.

July 25.—A residence was wrecked by lightning near Georgetown, and a man was killed by lightning near Hopkinsville.

July 26.—Hail destroyed 25 acres of tobacco in Scott County, with a loss estimated at $3,000.

July 30.—Four persons were injured and 20 others shocked by lightning that struck a tree near a funeral party at Valley, Jeenup County. A windstorm damaged buildings at Maysville.

July 31. Buildings were unroofed and two residences struck by lightning at Hopkinsville. A severe windstorm damaged wire systems in Ballard and adjoining counties.

A death at Louisville on the 9th and two on the 16th, also two deaths at Paducah on the 7th, were attributed to heat. Prostrations from heat were reported on several other dates.

Rivers. The streams of the State, including the Ohio, were at unusually low stages during the month. Navigation between Louisville and Evansville was impeded by low water.

Daily Temperatures for July, 1921.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., AUGUST, 1921. No. 8

GENERAL SUMMARY.

The drought that prevailed in June and July preceding was broken in the northern and eastern counties by good rains during the first week in August, while moderate showers in other districts afforded temporary relief. Heavy precipitation over the State in the period 11-14th, the first general rains since May, brought the drought to an end and started late crops to growing. On account of the large root systems developed during the dry weather, late corn and tobacco made unusually rapid and vigorous growth after the rains came. Early corn had nearly matured and was only slightly benefited; but the late portion of the crop received the moisture about the time of silking and tasseling, and had eared well by the end of the month, with promise of practically a full yield. Deficient sunshine and several cool nights during the first half of the month were rather unfavorable for corn, but ample sunshine and temperature above normal during the last two weeks were decidedly beneficial. Tobacco was unusually small when the rains occurred and, although it grew rapidly, much of it did not have sufficient time to reach full size. Topping was finished late, which will result in deferring maturity until there is danger of injury by frost. The showers favored the spread of rust, which appeared in both the burley and dark districts. Late potatoes, planted during the dry weather in July, had not come up well; but the rains and moderate temperature caused a marked improvement in the stand. The weather during the last two weeks was ideal for the growth of this crop. Pastures revived so quickly that plenty of grass was soon available, and feeding of stock was discontinued. Improvement in cow peas made possible the harvesting of a fair crop of hay during the last week. There was considerable improvement in alfalfa and second crop clover, also in young clover that had survived the drought. Fall plowing began during the third week, with the soil moist and mellow. Alfalfa was sown about this time under conditions favorable for germination. Gardens and truck farms were producing a good supply of vegetables at the end of the month.

TEMPERATURE.

The temperature for the month, 39 stations reporting, averaged 76° which is 0.3° above normal. Maximum temperatures of 90° or higher were registered generally during the first week, in the period 17-20th, and on the last three days; although the long period of continuous heat ended with the high temperatures of the 2d. Temperatures were moderate and the nights cool in the periods 8-16th and 22d-28th. The extremes at the various stations ranged between 101° at Bowling Green, on the 2d, and 48° at Greensburg on the 10th.

PRECIPITATION.

The average precipitation, based on the reports of 53 stations, was 5.28 inches, which is 1.72 inches above normal for August. The distribution over the State was in northeast-southwest belts, one covering most of the eastern mountain region, another extending from the lower Licking basin to Simpson County, and a third from the lower Green to the lower Cumberland. In these belts the monthly amounts ranged generally between 5.0 and 7.5 inches; while in the districts between them they ranged from 4.0 to 5.0 inches. In the agricultural portion of the State the heaviest precipitation generally occurred where drought conditions were most intense in July preceding. Light to heavy showers occurred on the 3d, and in the period, 6-7th. Moderate to heavy rains were general from the 11th to 18th, and local showers occurred in the central and western counties

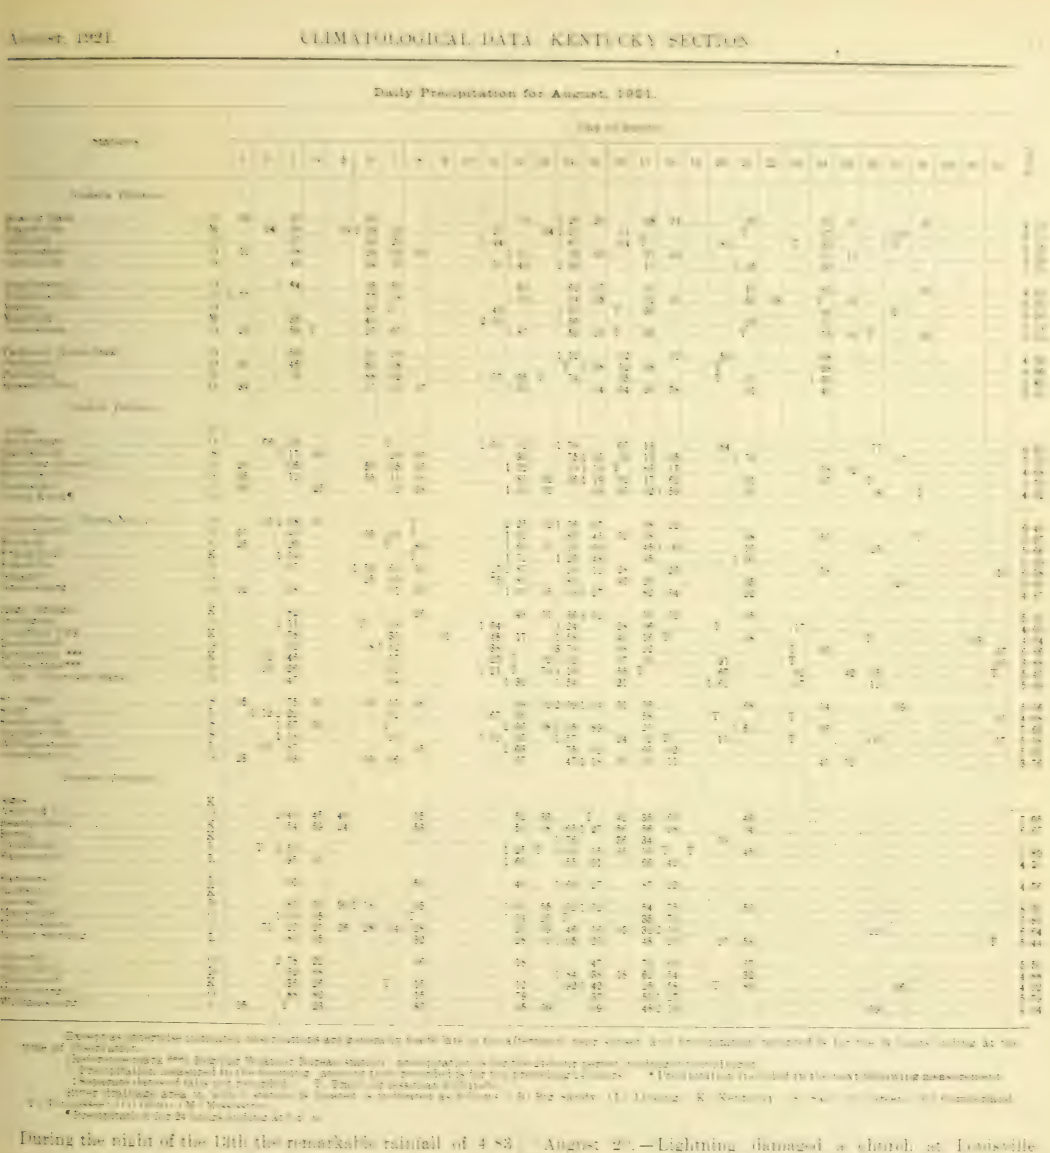
All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, "a", "b", "c", appearing in the table indicate number of days missing; for example, b represents two days, etc.
[f] Also on other dates. [d] Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
¶ Post-office address, Covington, Ky. *Temperature data by Evening Sun.

from the 21st to 28th. There were but few days without appreciable rainfall somewhere in the State. Amounts at the various stations ranged between 3.26 inches at Marion and 8.30 inches at Louisa. Thunderstorms of unusual intensity for August occurred frequently during the first three weeks.

MISCELLANEOUS



August 6.—A severe windstorm caused damage to buildings at Paducah estimated at $75,000. Some small river craft were sunk, and wire systems in McCracken County were considerably damaged.

August 8.—A residence was damaged by lightning at Hopkinsville.

August 11.—Near Clinton five head of horses, standing bunched together, were killed by a bolt of lightning.

August 13.—A man was shocked into unconsciousness by lightning at Hickman.

Daily Precipitation for August, 1921.

During the night of the 13th the remarkable rainfall of 4.83 and 5.36 inches was recorded at Lockport and Gest, Kentucky, respectively. (Locks Nos. 2 and 3, Kentucky River). At Lock No. 3, the river below the dam rose 14 feet and fell 11 feet during the morning of the 14th, and for an hour or so the river flowed up-stream over the crest of the dam, backing up the water about 1 1-2 feet at Lock No. 4. At Lock No. 2, the river rose over 18 feet and fell 11 1-2 feet in 18 hours.

August 2°.—Lightning damaged a church at Louisville. Wire systems were damaged by wind in the eastern part of Shelby County.

August 22.—One man was killed and two others injured by a tree that was blown across a cabin on the summit of Black Mountain, Letcher County.

Rivers.—The heavy rains caused temporary freshets of the Ohio and tributary streams, but moderate stages only were reached. These rises quickly subsided and low stages prevailed during most of the month.

Daily Temperatures for August, 1921.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., SEPTEMBER, 1921. No. 9

GENERAL SUMMARY.

High temperature, much cloudiness, and frequent showers characterized the month's weather. Except for a few days in the last week, daily mean temperatures were continuously above normal. The excess warmth caused rapid growth of late crops; but the lack of sunshine and persistent rains during three weeks offset to a marked degree the favorable effect of the high temperature, retarding the ripening process. Farmers began cutting early corn and tobacco during the first week, the work proceeding slowly, delayed by frequent showers and by the green, sappy condition of the crops. A week of warm, dry weather near the middle of the month gave impetus to all fall work, and was particularly opportune for cutting and housing tobacco, probably one-half of the crop being harvested at this time. Cloudy, showery weather prevailed during the last decade, with temperature on several days below normal. This cooler weather was beneficial to tobacco in barns, for the high temperature and humid atmosphere had caused some sweating. Early corn in shock dried slowly with some damage; while cowpea and alfalfa hay were injured by rain. Late potatoes grew well, but the development of the tubers was delayed by lack of sunshine. This crop was already late on account of unfavorable conditions at the time of planting, and the further delay endangered it from frost. Luxuriant pastures rendered feeding unnecessary. Only fair progress was made with fall plowing, due partly to the necessity of caring for the late crops and partly because the soil was frequently too wet to be worked. Late gardens yielded a fair supply of vegetables, but the weather was too wet for best results. Considerable rye was sown, chiefly for a cover crop; but weather and soil conditions being favorable for rank growth, the sowing of wheat was generally deferred until next month to avoid damage by the Hessian fly.

TEMPERATURE.

The temperature for the month, 40 stations reporting, averaged 75.5°, which is 5.5° above normal, and the highest on record for September since State averages were established. Maximum temperatures of 90° or higher were registered nearly every day during the first two decades, and the nights were especially warm, conditions being similar to midsummer. During the last decade the nights were cooler, but with the exception of a few days, day temperatures continued high. Extremes at the various stations were 99° at Hopkinsville and Paducah on the 4th, and 45° at Owensboro on the 30th.

PRECIPITATION.

The average precipitation, based on the reports of 54 stations, was 5.37 inches, which is 2.61 inches above normal for September. The distribution over the State was exceptionally irregular for an autumn month. In the lower and upper Green River basin, and immediately north of the upper Cumberland there were restricted areas in which amounts ranged from 8.0 to 9.5 inches. In the extreme northern counties about the mouths of the Kentucky and Licking rivers, amounts varied from 3.0 to 4.0 inches. In most other sections the monthly rainfall ranged from 4.0 to 6.0 inches. Showers occurred daily, with heavy rainfall somewhere in the State nearly every day, in the periods 1st-12th and 17-30th. There were only three days during the month without appreciable rainfall. Precipitation occurred mainly in connection with thunderstorms which were unusually frequent for this month.

MISCELLANEOUS

Sept. 6.—A barn was burned by lightning at Franklin.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, [b], †, appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

* Also on other dates. † Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.

¶Post-office address, Covington, Ky. *Temperature data by Evening Sun.

Sept. 7.—A youth was killed by lightning near Slaughters, Webster County.

Sept. 11.—A hailstorm destroyed considerable tobacco near Augusta.

Sept. 13.—The overflow of creeks, due to heavy rains, caused considerable damage to crops on lowlands near Campbellsburg. Corn and tobacco were damaged by wind and hail in Montgomery County.

Sept. 17.—A windstorm at Louisville unroofed several buildings and blew down many shade trees. A barn and oil tank were burned by lightning, the value of oil lost being estimated at $85,000.

Rivers:—Rains in the period 21st-25th caused a moderate rise to good stages in the Ohio River, and in tributary streams in eastern Kentucky; otherwise comparatively low stages prevailed during the month.

Daily Precipitation for September, 1921.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount thus recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Precipitation for 24 hours ending at 3 p. m.

Daily Temperatures for September, 1921.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION

JAMES L. KENDALL, Meteorologist.

Vol. XXVI. LOUISVILLE, KY., OCTOBER, 1924. No. 10

GENERAL SUMMARY.

Unseasonably cool weather prevailed during the first half of the month, and abnormally warm weather during the last half. Showers in the first week delayed tobacco and corn cutting, and interfered with fall plowing. The cloudiness and moist atmosphere retarded the curing of tobacco, and caused molding of corn in shock and damage to cowpea hay in process of curing. After the advent of fair weather about the 4th, rapid progress was made with harvesting the late crops of corn and tobacco, and the work was completed in good time with no frost damage of consequence. Late potatoes did not fully mature, partly because of their late start in August and the delay to their growth caused by the wet weather in September, and partly on account of the low temperature of the first two weeks of October. This crop was therefore cut short in its development by the killing frost that occurred generally over the State on the 13th. The dry, sunshiny weather that continued for about three weeks after the 4th was decidedly favorable for plowing, sowing wheat and timothy, curing tobacco, and drying out corn. The sowing of wheat in the northern counties was practically completed by the middle of the month, and in the southern counties in the following week. Favorable soil and temperature conditions resulted in quick germination and excellent stands of wheat, rye, and timothy. Most wheat was up by the end of the month, and growing vigorously under the stimulus of the unseasonably high temperature. Timely rains during the last week were beneficial to fall grains, pastures, and young grass, for the soil was becoming somewhat dry in most districts. The moisture was deficient in the western counties, where rain was still needed at the end of the month.

TEMPERATURE.

The temperature for the month, 40 stations reporting, averaged 57.1°, which is 0.7° below normal. Except on one day temperatures averaged abnormally low from the 1st to 15th, inclusive, the deficiency on several days ranging from 10° to 15°. The temperature reached freezing at a few stations on the 5th, 8th, 9th, and 12th, with frost in many localities. Temperatures below freezing were registered at nearly all stations on the 13th and 14th, with killing frost. Except on two days, temperatures in the period 16th-31st were continually above normal, the excess on most days ranging from 5° to 15°, while maximum temperatures were frequently above 80°. Extremes at the various stations were 90° at Bowling Green on the 25th, and 24° at Greensburg and Junction City on the 13th.

PRECIPITATION.

The average precipitation, based on the reports of 54 stations, was 2.29 inches, which is 0.21 inch below normal. In a considerable district in the central part of the State, also in a limited area in the northeastern corner, the rainfall exceeded the normal October amount, ranging from 3.00 to nearly 5.00 inches. In all other districts, including the western, southern and most of the mountain counties, the monthly totals were deficient, ranging generally from 1.00 to 2.50 inches. A few of the extreme western counties received less than an inch. Showers occurred generally in the periods 1st-2d, 7-8th, and 27th-31st; also in central and eastern districts on the 19th-20th. There were a few heavy local rains on the 29th and 30th, otherwise precipitation occurred in light to moderate showers. Amounts at the various stations ranged between 0.40 inch at Cynthiana and 4.73 inches at Greensburg.

State averages and extremes				57.1	.....	90	25	24	13	48										

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, "[1]", appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ¶ Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow.
¶Post-office address, Covington, Ky. *Temperature data by Evening Sun

MISCELLANEOUS.

Rivers.—The streams of the State were low, and pool stage continued in the Ohio river during the month. Navigation was impeded by low water in the section of the Ohio between Louisville and Evansville

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland T; Tennessee; (O) Ohio; (M) Mississippi.

¶Precipitation for 24 hours ending at 3 p. m.

Daily Temperatures for October, 1921.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., NOVEMBER, 1921. No. 11

GENERAL SUMMARY.

The first half of the month was comparatively dry and somewhat cold, temperature averaging below normal most of the period. Winter grains looked well but grew more slowly because of the low temperature. Growth of grass nearly ceased, and although pastures were good at the beginning of the month they became quite short toward the middle. Corn dried out sufficiently for cribbing, and the work of gathering was greatly accelerated by the favorable weather, being about half completed by the end of the second week. A change to abnormally high temperature, accompanied by rain, occurred on the 16th, ushering in a period of heavy and continuous precipitation that caused the suspension of most outdoor work. Corn fields were too soft to enter with teams, while shocks were soaked through and ears began to mold. The excessive rains caused much damage to bridges, roads, soil on slopes, and crops in lowlands, the losses being greatest in the western half of the State. Thunderstorms, remarkable for frequency, duration, and intensity of electrical display, occurred daily during the periods 16-19th and 23d-27th. The storm on the morning of the 17th at Louisville was similar to the severest that occur in this section in July, lightning and thunder continuing for five and one-half hours.

Farmers utilized the warm, moist weather to begin stripping tobacco; while handling, packing and marketing of old tobacco were also very active in the dark district. The abundant moisture and high temperature, ranging most of the time from 10° to 20° above normal, caused renewed growth of grains and grasses. Although too late to expect much of pastures, they revived to such an extent as to furnish good grazing until the end of the month. A serious effect of the warmth was the expansion of fruit buds, which passed into the winter in poor condition to withstand severe freezes.

TEMPERATURE.

The temperature for the month, 41 stations reporting, averaged 49.7°, which is 3.6° above normal. Minimum temperatures of freezing or a few degrees below were registered on most days during the first half of the month; but maximum temperatures of 70° or higher were frequent. During the last two weeks maximum temperatures were somewhat higher, while minima seldom fell to freezing. Extremes at the various stations were 79° at several stations on the 6th, 14th, 18th and 26th; and 20° at Greenville on the 12th.

PRECIPITATION.

The average precipitation, based on the reports of 54 stations, was 7.96 inches, which is 4.61 inches above normal, and the heaviest on record for November in this State. In the northern, central and western counties monthly amounts ranged between seven and nine inches; but in a limited area near the Ohio River, and in another district including a large part of the upper Green River basin, they ranged from 10 to 13 inches. In most of the mountain region from four to six inches occurred, the amount diminishing toward the southeast. Moderate to heavy rains occurred generally on the 1st, and somewhat lighter rains on the 9th. In the periods 16-19th and 23d-28th precipitation was excessive in nearly all parts of the State. On the 17th 24-hour amounts ranged from 1.00 to 4.00 inches at most stations, followed on the 18th in the western counties by equivalent downpours. Excessive rains were again general on the 27th and 28th. Amounts at the various stations ranged between 3.78 inches at Pikeville and 13.07 inches at Blandville.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, †, °, appearing in the table indicate number of days missing; for example, b represents two days, etc.
T Precipitation is less than 0.01 inch rain or melted snow.
* Also on other dates. †† Received too late to be included in means and summaries.
¶ Post-office address, Covington, Ky. *Temperature data by Evening Sun.

MISCELLANEOUS

November 16.—A faint auroral display was observed at Louisville, accompanied by some interference with wires. A barn was burned by lightning near Independence, Kenton County, with a loss of $2000.

November 17.—Severe windstorms, heavy rains, and lightning caused widespread damage in the central and western counties. At Danville the gas and electric plants were disabled and wire systems were damaged, the losses being estimated at $20,000. In Logan County a church, schoolhouse, and many tobacco barns were wrecked by wind. At Winchester, Nicholasville, and Shelbyville flood waters entered many buildings. The loss at Nicholasville from this cause was estimated at $8,000. Damage in Louisville and vicinity from flooded cellars and from wrecked bridges along Bear Grass Creek was estimated at $5,000 to $10,000. Corn shocked in the lowlands along Salt River was damaged by floods. Several stock barns in McCracken

Daily Precipitation for November, 1921.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Precipitation for 24 hours ending at 3 p. m

County and a mill valued at $10,000 in Ballard County were destroyed by lightning.

November 18.—Buildings, telephone systems, and timber were damaged by wind in Warren County.

November 19.—A windstorm unroofed buildings, and damaged wire systems in Louisville and vicinity. A local storm, showing some characteristics of a tornado, destroyed several barns in the bottoms west of Hickman. Windstorms destroyed many tobacco barns in Daviess and Todd counties, and damaged buildings in Bracken County.

November 26.—Roads were damaged to the extent of $20,000 in Ballard County by excessive rains.

Rivers.—Green River reached flood stage at Woodbury on the 29th, at Brownsville on the 30th, and was near flood stage at Rumsey on the 30th. The Ohio rose moderately during the first week, followed by another rise to comparatively high stages in the period 17th-21st. A third rise, starting in the upper reaches on the 25th, continued at the end of the month, causing high stages generally. Flood stage was reached at Evansville, and nearly reached at Catlettsburg and Portsmouth, on the 30th.

Daily Temperatures for November, 1921.

VOL. XXVI. LOUISVILLE, KY., ANNUAL, 1921. No. 13

GENERAL SUMMARY.

The average temperature for the year 1921 was the highest on record for the State, exceeding by nearly two degrees the highest previously recorded. The temperature averaged above normal for every month except October, the excess being especially large for the months of January, February, March, June, July, and September. Precipitation for the year averaged near normal, but there was a marked deficiency during the period May 15th-August 2d, associated with high temperature and damaging drought. All early crops were seriously injured, especially potatoes and oats which were a failure in many districts; while the growth of tobacco was so retarded that the crop matured unusually late and with reduced yield. The special features of the year's weather were the periods of abnormally high temperature in late winter; the disastrous freezes late in March and during April that destroyed most of the fruit; the wet weather of April and early May that delayed planting and hindered germination; the summer drought; the wet September that interfered seriously with saving the crops, and the excessive rainfall in November that caused floods and damage to corn in the field. The unseasonably warm weather in the period, January-March, averaging 7.0° above normal for the three months, caused such premature growth and tender condition of vegetation that the freezes in March and April wrought unusual damage for the time of year. Persistent wet weather in April and the first half of May hindered all spring work, particularly the planting of potatoes and sowing of oats, the delay in this work being an important factor in causing the partial failure of these crops. Poor germination of corn resulted in much replanting. A period of high temperature and local rainfall set in about May 15th, continuing until about August. Soil moisture was soon depleted by the intense heat, and drought became apparent locally in June; spreading to all districts during July, with heavy damage to oats and early potatoes and serious injury to early corn and tobacco. Yields of wheat and hay were reduced, but the favorable harvest weather contributed to the fine quality of these crops. Early tobacco grew unevenly, while the late planting remained quite small and made no growth of consequence until the rains began early in August. Late corn withstood the drought well, and the August rains came in time to mature a good crop. Although September was remarkably warm, cloudiness and wet soil delayed the maturing of late crops. Corn and tobacco were harvested under difficulties, and not without some loss from unfavorable weather. Late potatoes did not complete their growth before frost, otherwise crops were safe when killing temperatures occurred. Winter grains were generally sown during the second and third weeks of October, when moist soil and abnormally high temperature caused quick germination and rapid growth. Favorable weather for gathering corn prevailed during the first half of November, but excessive rains later in the month prevented most outdoor work. Dry, mild weather during the first three weeks of December made possible the completion of corn gathering. The long periods of unseasonably warm weather in the fall and early winter caused considerable expansion of fruit buds, which passed into winter in poor condition to resist low temperatures. Growth of grass continued about three weeks longer than usual, furnishing good pasturage through November.

THE WEATHER BY MONTHS.

JANUARY.—Unseasonably warm and spring-like weather prevailed, causing winter grains to begin growing and trees to show signs of budding. There was some snow protection during the two short periods of moderately cold weather. Precipitation was much less than normal, occurring in light to moderate showers, and was mostly absorbed by the soil, which was quite dry on account of shortage of moisture in previous months.

FEBRUARY.—Abnormally warm weather prevailed from the 3d to 17th. Wheat and grass made considerable growth, blossoms appeared on maple trees, and fruit buds showed marked indications of development. Growth was checked by a cold spell, attended by heavy snow, in the period 18-20th. Precipitation was near normal, and beneficial because of the relative dryness of the soil.

MARCH.—The average temperature was the highest on record for March in this State. Unseasonably warm weather prevailed until the 27th, followed on the 28th by a sharp cold wave and severe freeze which killed most of the fruit in blossom and injured apples, cherries, and grapes. All vegetation was unusually advanced for the season. Precipitation was heavy in the agricultural districts, interfering with spring work.

APRIL.—The temperature averaged above normal; but several severe freezes and killing frosts occurred during the first three weeks, practically completing the destruction of fruit and causing some injury to wheat. Precipitation averaged near normal, but the frequency of showers kept the soil wet and interfered seriously with sowing oats and planting potatoes. Preparation of soil and other farm work was delayed from two to three weeks. Germination of seeds was poor, and there was much replanting.

MAY.—Cold, cloudy, showery weather continued during the first half of the month, preventing much progress with plowing

All temperature data are taken from self-registering thermometers.
Reference letters, a, b, c, appearing in the Table indicate number of days missing; for example, b represents 2 days, etc.
†Also on other dates

and corn planting. Corn produced an uneven stand, causing much replanting later in the month. Gardens were exceptionally backward. Unseasonably high temperature, with conditions favorable for outdoor work and rapid growth of vegetation, prevailed during the last two weeks. Wheat developed very rapidly and unusually early, with indications of premature ripening in the dry districts. Early potatoes matured too quickly, with light yields; and oats and strawberries were injured by the abnormal heat and quick drying of the soil.

JUNE.—The month was unusually warm, the average being exceeded only in June, 1890 and 1914. Corn advanced rapidly, overcoming much of the delay due to late planting. Wheat continued to ripen prematurely, with many unfilled heads. Harvest arrived earlier than usual, followed quickly by thrashing because of the dry weather. Precipitation was much less than normal, and entirely local in character. The result was that drought conditions became established in large districts b the end of the month. Moisture was insufficient for tran planting tobacco, which caused the crop to be curtailed. Earl potatoes were badly damaged, being practically a failure i many places.

JULY.—The average temperature was only slightly below t record mean of July, 1901, which is the highest for the past years. Precipitation was light and local, drought becomi worse and more extended. By the end of the month prac cally all parts of the State were affected, resulting in serio damage to all early crops. The oats crop was a failure in ma districts, while early corn, young clover, and gardens suffer marked injury. Tobacco made but little growth, especially t last setting. Planting of early potatoes was delayed because dry, hot soil.

AUGUST.—The drought was broken in the northern and ea

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. T. Precipitation is less than 0.01 inch rain or melted snow.

ern counties during the first week, and generally over the State during the second week. Late crops were greatly benefited and grew rapidly after the rains. Tobacco was so small that it could not make a full crop, but late corn received the rains in time to make a good yield. Fall plowing began during the last week with the soil in excellent condition.

SEPTEMBER.—The average temperature was the highest on record for this month. The weather was favorable for growth, but in general not conducive to ripening of crops. Showers delayed cutting of corn and tobacco, and caused some damage to corn in shock and tobacco in barns. The lack of sunshine was unfavorable for the growth of late potatoes. Fall plowing made only fair progress, the soil being frequently too wet.

OCTOBER.—The first half of the month was unseasonably cool and the last half abnormally warm. Cloudiness and humid atmosphere caused further damage to corn in shock and to tobacco in barns during the first week, but crops in the field were generally harvested without loss. Killing frost on the 13th caused little damage except to late potatoes, which were still decidedly immature. Wheat was sown under excellent conditions, germinated quickly, and showed satisfactory stands.

NOVEMBER.—The first half was comparatively dry and cold, while the last half was abnormally wet and warm. Precipitation averaged heavier than in any other November of record, most of it occurring in two periods after the middle of the month. Much corn was gathered during the first two weeks, but this work was nearly suspended after the rains began. Floods in headwater streams caused damage to bridges, roads, and crops on lowlands, the losses being heaviest in the western counties. The rainy period was remarkable for the frequent heavy thunderstorms.

DECEMBER. The weather was mild and generally favorable for outdoor work. Winter grains continued to grow slowly during the first three weeks, but growth was checked by more seasonable temperature in the last decade. Corn gathering proceeded rapidly until stopped by heavy rains late in the month.

NIKE

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVII. LOUISVILLE, KY., JANUARY, 1922. No. 1

GENERAL SUMMARY.

Although the temperature for the month averaged near normal, it was especially variable even for midwinter, with well-marked departures in either direction. There were five short periods when mean temperatures were above normal, and a like number when they fell below. In the period 23d-25th, temperatures ranging from one to ten degrees above zero were registered in the central and eastern counties, and temperatures nearly as low in the same districts on the 2d and 14th. Minimum temperatures were somewhat higher in the western counties. The periods of high temperature were too brief to affect fruit buds, and it is believed that the low temperatures were not severe enough to cause injury of importance. The damage to winter grains by the frequent freezes and thaws was probably less than usual because the plants were splendidly rooted and the soil was better drained than is ordinarily the case at this time of the year. The condition of these crops was good to excellent at the close of the month. There was no snow cover of consequence. The ice storm of the 20th and the cold weather that followed until the 26th were severe on stock in the open and interfered with feeding; but during the rest of the month the weather was favorable for the care of animals outdoors.

The deficiency in moisture did not especially hinder the handling or delivery of tobacco, as most of it had been stripped or packed in bulk during the humid weather of the previous month. Dirt roads were very muddy at the beginning of the month, and the freezing and thawing kept them in bad condition. Some softening of highways resulted from the same cause, but in general their condition improved on account of the light precipitation.

TEMPERATURE.

The average temperature for the State, 40 stations reporting, was 34.6°, which is 0.6° below normal. In the periods, 3d-4th, 8-9th, 17-18th, and 30th-31st, mean daily temperatures ranged from 10° to 22° above normal; while in the periods 1st-2d, 12-13th, and 23d-25th, the departure below normal was practically the same. Minimum temperatures ranging from 8° to 15° were recorded at most stations on the 2d, 14th, and in the period 23d-26th Maximum temperatures were generally low, reaching 60° on only three days. Extremes for the month were 67° at St. John on the 4th, and 1° at Middlesboro on the 14th.

PRECIPITATION.

The average precipitation, based on the reports of 54 stations, was 2.25 inches, which is 2.14 inches below normal. In general its distribution over the State was the reverse of that during the preceding month, amounts in the northern and extreme western counties ranging from 0.5 to 2.0 inches, and in the south-central and southeastern districts from 3.0 to 5.5 inches. In most of the agricultural district only one-fourth to one-half of the normal amount occurred. Light to moderate showers, unusually variable and local in character for a winter month, occurred in the periods 4-5th, 8-13th, and 17th-21st; and a few heavy local rainfalls on the 11th. Sleet was reported from most northern counties on the 20th and 21st. Snowfall was light, ranging from a trace in the northern and eastern districts to 3.5 inches in the southwestern counties. Amounts of precipitation at the various stations ranged between 7.1 inches at Henderson, and 5.48 inches at Junction City.

MISCELLANEOUS

Rivers.—The Ohio River was above flood stage at Cloverport and Evansville at the beginning of the month, but receded rapidly to moderate stages during the first decade. The lower courses of the Green, Cumberland, and Tennessee also fell rapidly during the same period.

All temperature data are taken from self-registering thermometers.
Departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, †, °, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow
¶ Post-office address, Covington, Ky. *Temperature data by Evening Sun.

Errata. November, 1921, Scott, mean minimum temperature should be 37.0°, and mean monthly temperature should be 46.6°. Average temperature for the State [illegible] and departure from normal −3.7°.

Daily Precipitation for January, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Precipitation for 24 hours ending at 3 p. m.

Daily Temperatures for January, 1922.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVII. LOUISVILLE, KY., FEBRUARY, 1922. No. 2

GENERAL SUMMARY.

Temperature conditions during the month were similar to those prevailing in January preceding. Short periods of abnormally warm weather alternated with like periods of unseasonable cold, departures of the daily mean temperatures ranging from 18° below to 30° above normal. The spring-like warmth of the mild weather caused such development of fruit buds as to alarm orchardists; but the cold weather, recurring at frequent intervals, prevented blossoming. The most serious effect on fruit was produced by the 6-day period of high temperature from the 18th to 23d. In the southern counties peach buds seemed about ready to open, and plums were nearly as far advanced; the development of these fruits being fully a month ahead of their normal condition. A few days with freezing temperature near the end of the month checked this untimely development. During the second week winter grains and pastures made some growth, and the severe freezes that followed probably caused some injury to wheat. In general, however, wheat was so well rooted and vigorous in condition, except on watersoaked lowlands, that no serious damage resulted from any of the freezing weather. At the end of the month grass and grains resembled their usual appearance from two to three weeks later.

Precipitation averaged near normal; but most of it occurred during the last decade, causing floods in the central counties. Roads improved during the first half of the month, and tobacco was delivered with less difficulty than in January; but the hard freezes near the middle of the month, followed by persistent and heavy rains, put the dirt roads in bad condition and caused much injury to improved highways. The wet weather of the last decade prevented plowing and interfered with early sowing of tobacco plant beds. Snowfall was light over most of the State, but there was a district in the the east-central counties in which grains had some snow protection during the severe freezes of the 16th and 17th.

TEMPERATURE.

The average temperature for the State, 40 stations reporting, was 41.3°, which is 5.7° above normal. Maximum temperatures in the periods, 10-12th and 19th-23d, ranged generally from 60° to 70°; while minimum temperatures were above freezing. In the periods, 7-8th and 13-17th, minimum temperatures ranging from 4° to 20° were registered in all districts. Extremes for the month were 76° at several stations in the western counties on the 21st and 22d, and 4° at places in the east-central counties on the 16th and 17th.

PRECIPITATION.

The average precipitation, based on the reports of 55 stations, was 3.58 inches, which is 0.02 inch below the normal amount. In the counties near the Ohio River monthly amounts ranged from 1.8 to 3.0 inches, being generally below normal. In the central belt from the lower Tennessee River to the lower Big Sandy, they ranged from 3.0 to 5.0 inches; and in the south-central and south-eastern districts, from 5.0 to 6.6 inches. Amounts at the various stations ranged between 1.82 inches at Ashland and 6.59 inches at Williamsburg. Light to moderate showers occurred almost daily from the 1st to 16th; followed by heavy general rains, that caused headwater floods, in the period 18th-21st. Moderate showers also occurred on the 23d, 26th, and 27th. The total snowfall in the east-central and north-eastern counties was 1.0 to 3.0 inches, but only a trace occurred in most other districts. Sleet was reported on the 9th, 14th, and 28th. Thunderstorms occurred generally on the 12th, 19th, 20th, and 22d. Hail was reported from Irvington on the 19th and Fulton on the 20th.

State averages and extremes				41.3		76	21[1]	4	16.	37	3.58	.....	2.63	0.8	10	8	6	14	s.	

All temperature data are taken from self-registering thermometers.
Time of sunrise, from which temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining extremes or divisional means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Approximate data. [1] Received too late to be included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow.
† Post-office address, Cynthiana, Ky. *Temperature data by Evening Sun.

Errata. November, 1921, Scott county, mean monthly temperature should be 46.6°. Average temperature for the State should be 42.7° and departure from normal, −3.7°.

MISCELLANEOUS

Feb. 20.—Two barns were destroyed by lightning near Blandville.

Rivers.—Heavy rains in the central and southern counties from the 19th to 21st caused flood stage in the upper Kentucky River, and stages near the flood level in the middle and lower sections. The crest at Beattyville was 35.0 feet on the 21st. Flood stages were also reached in the Green River from the 21st to 25th. Crests in that stream were as follows: 33.0 feet at Brownsville on the 24th; 39.1 feet at Woodbury on the 23d; and 35.6 feet at Rumsey on the 28th. A sharp rise began in the upper Ohio on the 21st, resulting in moderately high water but not reaching flood stage at any station. There was considerable flooding of lowlands, especially in the Green River basin, but no damage was reported.

Daily Precipitation for February, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning: amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking: (K) Kentucky: (S) Salt: (G) Green: (C) Cumberland (T) Tennessee: (O) Ohio: (M) Mississippi.

¶ Precipitation for 24 hours ending at 3 p. m.

Daily Temperatures for February, 1922.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVII. LOUISVILLE, KY., MARCH, 1922. No. 3

GENERAL SUMMARY.

A short period of low temperature at the beginning of the month, a continuation of the colder weather that set in toward the end of February, was decidedly important and beneficial in checking sharply the tendency of fruit buds to premature blossoming. Because of this check peaches and plums did not bloom until the last week. Mild weather, broken by a few days with freezing temperature, prevailed after the 4th. Winter grains, pastures, meadows, clover, and alfalfa started vigorous growth early in the month and at its close had reached a condition probably three weeks ahead of the season.

Precipitation was exceptionally heavy and frequent, even for March, approaching the record for this month for the State and exceeding the record at several stations. Plowing was possible on a few days in the third and fourth weeks, but the work was stopped by rain before much was accomplished. Tobacco plant beds were being sown all through the month, when the weather would permit, but this work could not be completed, because of the continued rains. No progress of consequence was made in sowing oats or planting potatoes. Crops on upland or well drained soils were not injured by the rains, but wheat and other winter grains on lowlands or wet soils were seriously damaged and practically drowned out. This condition was most prevalent in the western counties where the rainfall was heaviest and lowlands overflowed during about half of the month. Floods along many streams caused damage to land, roads, fences, and bridges; while the flood waters stood on the lowlands in the western counties so long as to destroy the crops that were growing on them. Probably the most serious effect of the floods was the delay in plowing the overflowed lands.

TEMPERATURE.

The average temperature for the month, 40 stations reporting, was 49.4°, which is 3.4° above normal. Freezing temperatures occurred generally in the periods 1st-4th, 8-9th, and 20th-22d. Maximum temperatures ranging from 60° to 70° were registered at most stations in the periods 10-19th, and from 65° to 75° in the period 23d-31st. Temperatures were favorable for growth of early vegetation most of the time during the last two decades. Extremes for the month were 83° at Ashland on the 30th, and 19° at Scott on the 3d.

PRECIPITATION.

The average precipitation, based on the reports of 55 stations, was 8.11 inches, which is 3.45 inches above normal, and the highest on record for March except in 1890, when the average amount was 8.34 inches.

In the southern and western counties monthly amounts ranged between 8.0 and 12.0 inches, and in the northern counties from 6.0 to 8.0 inches. In the basin of the upper Green River the total precipitation was more than 10 inches. Amounts at various stations ranged between 4.70 inches at Pikeville and 12.68 inches at Blandville. Except in the period 22d-25th, rain occurred daily somewhere in the State. It was moderate to heavy in the periods 1st-2d, 6-7th 9-10th, 14-15th, 19-20th, 26-27th, and 30th-31st, besides showers that occurred on other dates. The total snowfall ranged from 1.0 to 4.0 inches in the east-central counties, but there was none of consequence elsewhere. Sleet was reported generally on the 1st, and from several stations on the 7th. Thunderstorms occurred on the 10th, 14th, 19th, 28th, 29th, and 30th, frequently accompanied by hail.

State averages and extremes		.....	.....	49.4	.....	83	30	19	3	43	8.11	.....	3 05	0.5	14	9	6	16	e.	

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.

T. Precipitation is less than 0.01 inch rain or melted snow.

* Also on other dates. ** Received too late to be included in means and summaries. §Temperature data by Evening Sun.

¶Post-office address, Covington, Ky.

Errata. November, 1921.—Scott, mean minimum temperature should be 37.0°, and mean monthly temperature should be 46.6°. Average temperature for the State should be 49.3° and departure from normal +3.7°.

MISCELLANEOUS

March 7 — A church was unroofed by a windstorm at Winchester.

March 10. — Buildings were damaged by wind at Dry Ridge.

March 14 — Two oil tanks were blown down and three men injured by a windstorm in Warren County.

March 28. - A farmer was shocked into unconsciousness by lightning near Bloomfield.

March 30. — Telephone and telegraph wires were damaged by wind at many places in the State, especially in the eastern counties. Earth tremors were reported at 10.53 a. m. and 1.06 p. m., in the extreme western counties.

Daily Precipitation for March, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

2 Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Precipitation for 24 hours ending at 8 a. m.

Rivers:—The Ohio River was moderately high at the beginning of the month. It passed flood stage at Evansville on the 14th, and was practically bankful from Catlettsburg to Cairo. Heavy rains over the basin on the 14-15th caused a rapid rise, and flood stage was passed in most of the section from Cincinnati to Cairo on the 16th. Crests reached in the stretch from Cincinnati to Louisville were slightly above flood stage, but the water was much higher in the lower course. Flood conditions continued at Paducah and Cairo, also in the Mississippi from Cairo to Hickman, during the remainder of the month. Two flood waves, with crests several feet above flood stage, occurred in Green River. These merged into one in the lower course, where the river continued above flood stage from the 6th to the 30th. Flood heights did not occur in the tributaries in the central and eastern parts of the State.

Daily Temperatures for March, 1922.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., APRIL, 1922. No. 4

GENERAL SUMMARY.

During the first half of the month unseasonably warm weather prevailed, stimulating vegetation to unusually rapid growth. The advanced condition of wheat, which began to joint during the first decade, caused anxiety in regard to possible frost injury later. A sharp change to colder on the 18th was followed by low temperature during the remainder of the month. Light frost generally over the State on the 20th, and in the eastern counties on the 21st, caused no damage; but heavy frost on the 23d injured tender vegetables, early strawberries, cherries and apples, especially in valleys and low places. Wheat suffered no injury of consequence. Minima of 27° to 32° were registered at many stations on the 23d, but the temperature remained at the lowest point probably less than an hour and then rose quickly above freezing. This peculiarity seems to explain why such low temperatures could be reached without more extensive damage to fruit.

Precipitation averaged near normal, but it occurred with such frequency as to keep the soil too wet to plow most of the time. There were several days of favorable weather in the last decade when considerable plowing and planting were accomplished; otherwise this work was seriously delayed. The full acreage of oats and potatoes could not be planted for this reason, while a considerable part of both crops was planted much later than desirable. The heavy rains near the middle of the month damaged apples and cherries, in bloom at that time, by washing away the pollen and thus preventing fertilization. Much fruit was not sprayed because orchards could not be entered with teams at the proper time on account of the saturated soil. The wet weather favored the formation of wheat rust, which appeared locally near the end of the month. Tobacco plants grew well and were plentiful.

TEMPERATURE.

The temperature for the State, 42 stations reporting, averaged 59.5°, which is 3.6° above normal. In the period 3d-17th mean daily temperatures ranged from 10° to 20° above normal on most days; while from the 18th to the end of the month they ranged from 3° to 10° below. On the first two days and also on the 20th and 23d, minimum temperatures near freezing occurred at most stations. The lowest temperatures of the 23d varied considerably, depending apparently on whether the station was so located as to be affected by air drainage, stations so affected registering the lowest minima. The extremes for the month ranged between 88° at Williamsburg on the 14th and 25° at Berea on the 2d.

PRECIPITATION.

The average precipitation for the State, based on the reports of 56 stations, was 4.24 inches, which is 0.30 inch above normal. The distribution over the State was quite irregular. Monthly amounts ranged between 4.0 and 7.0 inches in the extreme western counties, the southeastern district, and in the northern blue grass region. In the west-central counties and eastern mountain region, they ranged from 3.0 to 4.0 inches, being generally below normal. Rain in appreciable amounts occurred almost daily somewhere in the State from the 5th to 18th, while moderate to heavy showers were general in the periods 5-6th, 9th, 11th, 14-15th, 17th, and 25-28th. Rainfall was excessive at many stations on the 14th, accompanied by hail at several places in the northern counties. Amounts at the various stations ranged between 2.68 inches at Irvington and 7.13 inches at Middlesboro. Thunderstorms were reported on the 5th, 7th, 9th, 10th, 14th, 15th, and 17th.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Received too late to be included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow.
¶Post-office address, Covington, Ky. *Temperature data by Evening Sun.

April 14.—A farmer was killed by lightning near Midway, Ky. A rainfall of 0.92 inch at Louisville, Ky. in 15 minutes flooded basements and raised Bear Grass Creek so high as to obstruct street car and interurban traffic in the eastern part of the city. A 7-year old boy was drowned in the flood waters of the creek. Windows were broken and fruit damaged by heavy hail near Eastwood, Jefferson County.

April 15.—A windstorm damaged trees, fences and buildings at Williamsburg, Ky.

Rivers.—The swell in the Ohio River at the beginning of the month increased the flooded condition in the lower course. At Evansville the river was above flood stage from the 5th to 10th. Another sharp rise was caused by the rains of the 14th and 15th, resulting in stages a few feet under the flood line in the section

Daily Precipitation for April, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

(L) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

: Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

from Catlettsburg to Louisville. In this rise the river was above flood stage at Cloverport on the 21st and 22d, at Evansville from the 19th to 26th, and at Paducah from the 24th to 29th. The Mississippi along the western border of the State, and the extreme lower course of the Ohio stood several feet above flood stage during the entire month. Green River was high but reached flood stage at Woodbury only, on the 4th. A part of Hickman, Ky. was flooded all of the month. The most serious effect of the protracted flood along the Mississippi and lower Ohio was the delay in plowing bottom lands.

Daily Temperatures for April, 1922.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., MAY, 1922. No. 5

GENERAL SUMMARY.

Except for the high temperature during the second week, which was rather severe on teams, weather conditions were exceptionally favorable for plowing and planting. The delay caused by the persistent wet weather of April preceding could not be entirely overcome, however, and farm work was still somewhat behind when the month closed. Showers during the first week interfered with plowing and planting, but progress was rapid after the 7th. The germination of corn was accelerated by the excess warmth, resulting in a uniform stand and a vigorous start in growth. The moderate temperature, showers, and cloudiness during the last two weeks were favorable for the growth and ripening of strawberries, which were unusually fine and abundant. This weather also caused marked improvement in potatoes, and in a measure offset the deficiency in precipitation. Transplanting tobacco began in the dark district during the second week, and was about three-fourths completed at the end of the month. In the burley district it began during the third week, and was about half completed when the month closed, being delayed somewhat from lack of rain. Wheat headed and improved generally, the dry weather and sunshine early in the month checking the rust and restricting it to small areas. Clover hay and the first crop of alfalfa were put up under satisfactory conditions for curing in most districts. Oats grew well, but the crop was late, weedy, and variable in condition. Although planted late, gardens improved so rapidly as to be nearly abreast of the season. Peaches were fine and other fruit was generally a fair prospect.

The deficient precipitation was more favorable than otherwise, as it permitted the maximum progress with farm work. Showers were general during the first week, but later they were local and mostly light.

TEMPERATURE.

The temperature for the State, 41 stations reporting, averaged 67.9°, which is 2.3° above normal. In the periods 7-13th daily temperatures averaged 5° to 13° above normal; while they were below normal from the 17th to 20th and near the end of the month. It was also quite warm for a few days following the 22d. On most nights temperatures below 60° were registered, and on a few nights they fell below 50°. The extremes were 94° at Bowling Green on the 11th, and 35° at Marion on the 1st.

PRECIPITATION.

The average precipitation for the State, based on the reports of 55 stations, was 3.87 inches, which is 0.08 inch below normal. The deficiency was greatest in a large area including most of the northern blue grass region and in the extreme western counties, where the monthly amounts ranged between 1.5 and 3.0 inches. In the district from the middle basin of the Green to the mouth of Salt River, also in the southeastern counties and most of the mountain region, amounts ranged from 4.0 to 9.0 inches. Moderate to heavy rains occurred in the period 1st-6th, and scattered local showers, varying greatly in amount, in the periods 10-13th, 17-19th, and 23d-27th. In the central and eastern counties the rain periods were better defined and the precipitation more general. Amounts at the various stations ranged between 1.50 inches at Frankfort and 9.39 inches at Beaver Dam. Thunderstorms were frequent, accompanied by hail on the 6th, 9th, 10th, 17th, 18th, and 25th.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, *, appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Associated dates. ‡ Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.

¶ Post office address, Covington, Ky. *Temperature data by Evening Sun.

MISCELLANEOUS

May 5.—Bridges and roads were washed away along headwater streams in Pike and Letcher counties.

May 9.—A stock barn at Lexington was destroyed by lighning with a loss estimated at $500,000. Twenty-six valuable race horses were lost. A farmer was killed by lightning near Pewee Valley.

May 19.—A man was killed near Henderson while driving cattle on a railroad during a heavy hailstorm.

May 20.—Several houses and barns were unroofed, and one person was injured, by a windstorm near New Haven, Ky.

May 27.—An excessive rain in northern Warren County caused a washout on a small creek in which several houses were carried away.

Rivers:—The Ohio at Cairo and the Mississippi along the western border were above flood stage from the 1st to the 7th, but they fell slowly and reached moderate stages by the end of the month. In general the river declined slowly in all sections, reaching pool stages in the upper and middle stretches.

ERRATA. April, 1922: St. John, monthly precipitation should be 3.59. Average precipitation for the State should be 4.25, and departure from the normal +0.21.

Daily Precipitation for May, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

Daily Temperatures for May, 1922.

UNIVERSITY OF ILLINOIS
AUG 8 1922

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., JUNE, 1922. No. 6

GENERAL SUMMARY.

High temperature, local and generally deficient precipitation, with drought in large districts, characterized the weather conditions. In the northeastern counties and in the lower Green River basin drought became well defined early in the month, while at its close the area in which crops were suffering for rain included more than half of the State. Cool weather and dry soil were unfavorable for germination and growth of corn during the first week. This was followed by a long period of high temperature that continued in the western counties until the end of the month, but was modified somewhat by the cooling effect of local showers during the last decade in the central and eastern districts. Where moisture was sufficient, the excess warmth caused marked advancement in corn and early tobacco; but in the dry areas growth of both crops was slow and much of the last setting of tobacco died. Cultivation was generally satisfactory and somewhat cleaner than usual because of the favorable weather for eradicating weeds. The dry, warm weather prevented complete filling and caused premature ripening of wheat and rye. Harvest commenced earlier than usual, beginning in the southern counties on the 6th, in the central belt on the 10th, and at the extreme north on the 14th. Thrashing followed about two weeks later, with weather conditions favorable and the grain dry and sound, but with yields decidedly disappointing. Setting late tobacco was delayed, and in some districts prevented, by dry weather; but the total acreage planted was large. Early potatoes matured too quickly, with unsatisfactory yields in most districts and practically a failure of the crop in the driest localities. Oats headed short and made a poor crop. Timothy hay harvest commenced in the southern counties during the last week, with the weather favorable for curing. Gardens and pastures were in fair condition, but needed rain badly when the month closed.

TEMPERATURE.

The temperature for the State, 40 stations reporting, averaged 75.4°, which is 1.7° above normal. Except for a few days in the last decade, mean daily temperatures were almost continuously above normal after the 5th. Maximum temperatures of 96° or higher were reached nearly every day during the last three weeks, occurring most generally in the western counties. Minimum temperatures were low in the periods 1st-6th and 23d-25th. The extremes were 100° at several stations on the 15th, 16th, and 17th; and 44° at Farmers on the 23d.

PRECIPITATION.

The average precipitation for the State, based on the reports of 56 stations, was 3.10 inches, which is 1.08 inches less than normal. The distribution was very irregular, amounts for the month recorded in adjoining counties differing by 2.0 to 3.0 inches. It is also noteworthy that the dry areas in the northern blue grass region and in the extreme western counties coincided in a large measure with the dry districts in May preceding. There was a marked deficiency in the north-central and northeastern counties, and from the lower basin of the Green to the mouth of the Ohio, where monthly amounts ranged between 1.5 and 3.0 inches. About 20 counties in the northeastern part of the State received less than 2.0 inches. In the southern counties, and in the district from Hancock to Jefferson, amounts ranged from 3.5 to 6.0 inches; but the normal June rainfall was exceeded at only a few stations. Scattered showers occurred during the first decade, being fairly general on the 9th; also in the periods 12-14th, 17th-21st, and 26-29th. Amounts at the various stations ranged between 0.35 inch at Vanceburg and 6.86 inches at Greenville. Thunderstorms were frequent at all stations, and were attended by hail in a few instances.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.
T. Precipitation is less than 0.01 inch rain or melted snow.
a Also on other dates. b Received too late to be included in means and summaries.
¶Post-office address, Covington, Ky. *Temperature data by Evening Sun.

MISCELLANEOUS

June 8.—A rainfall of 1.13 inches in 15 minutes at Louisville flooded basements, rendered streets temporarily impassable for street cars and automobiles, and caused a serious cave-in on a large sewer.

June 11.—Two persons were overcome by heat at Louisville. In Owen County a man and wife were killed when their house was destroyed by wind. Numerous farm buildings were demolished and telegraph and telephone communication was interrupted. Heavy hail that damaged crops accompanied this storm.

June 17.—Four men were killed and five injured by a bolt of lightning that struck a shed in which the men had taken refuge near Valley Station, Jefferson County.

June 19.—Damage estimated at $25,000 was caused by a washout at Springfield.

June 27.—Heavy hail occurred locally at Berea but without serious damage to crops.

June 29.—Seven head of cattle were killed by lightning, and crops damaged by heavy rain in Adair County.

Rivers:—Stages were low in all streams, including the Ohio, during the month.

Daily Precipitation for June, 1922.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., JULY, 1922. No. 7

GENERAL SUMMARY.

Moderate temperature, with daily averages below normal on most days, prevailed during the first three weeks. The precipitation in various parts of the State exhibited marked contrasts. In some districts, particularly the west-central and southeastern counties, the rainfall was so frequent and heavy as to interfere with thrashing, haying and cultivation of crops, and caused some damage to wheat in shock; while in other sections, principally the Licking Valley and northeastern counties, drought of more or less intensity continued throughout the month. In the dry districts precipitation was local and rarely sufficient in amount anywhere to thoroughly moisten the soil and produce satisfactory growing conditions. In general the rains were heaviest in the districts that received most rain in May and June preceding, and lightest where deficient during these months. Rainfall was sufficient over about three-fourths of the State, including the southern, and most of the western counties. In this district corn made excellent progress, and late potatoes were planted under favorable conditions; while the advancement of early tobacco was such that cutting had commenced in a few places by the end of the month. In the dry northeastern counties, including considerable areas in the northern blue grass and burley district, early corn and tobacco "fired" badly during the last two weeks, late tobacco grew unevenly and was retarded; pastures dried up, and stock water became short. In this section, however, thrashing and hay harvest proceeded without delay, and the spread of tobacco rust was prevented. This disease was apparently confined to certain wet localities in the western "dark" district. Except in the northeastern counties, gardens yielded a plentiful supply of vegetables. Tomatoes were about ready for the canneries at the end of the month. A remarkably large crop of peaches began ripening, and there was also plenty of other fruit.

TEMPERATURE.

The temperature for the State, 42 stations reporting, averaged 76.4°, which is 0.3° below normal. Low minimum temperatures occurred in the periods 4-7th and 19th-22d, ranging from 47° to 56° at most stations. Temperatures of 90° or higher were registered on the 1st, and in the periods 9-12th and 25th-31st generally over the State; while maxima of 95° to 100° occurred at a few stations in the dry districts. The extremes were 102° at Paducah, on the 28th and 29th, and 47° at Earlington and Owensboro on the 5th.

PRECIPITATION.

The average precipitation for the State, based on the reports of 56 stations, was 4.77 inches, which is 0.47 inch above normal. Areas of light and heavy precipitation coincided to a marked degree with similar districts in June preceding. Distribution was decidedly irregular, rainfall in many cases being excessive in one county and deficient in that adjoining. In the Salt River basin and eastward, including most of the district northeast of the Kentucky river, monthly amounts ranged from 2.0 to 4.0 inches. This area corresponds roughly with the area most affected by drought in June. There were also districts in the extreme western counties, where less than 4.0 inches occurred. In the south-central and southeastern counties rainfall was generally heavy, ranging between 5.0 and 9.0 inches; while in some west-central localities and in Jefferson County, it ranged between 4.0 and 9.0 inches. Showers were fairly general, but varied greatly in amount, in the periods 2d-4th and

Temperature observations are taken from self-registering thermometers.
The departures of mean temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Report of too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
¶ Post-office address, Covington, Ky. *Temperature data by Evening Sun.

7-8th. Showers also occurred locally in the periods 12-13th, 18-19th, 23d-24th, and 30th-31st. Amounts at the various stations ranged between 1.55 inches at Maysville and 9.06 inches at Cherokee Park. Thunderstorms were frequent and often attended by damage from wind and lightning.

MISCELLANEOUS

July 3.—Near Danville a man was killed when lightning struck a rural mail box from which he was taking mail.

July 7.—At Louisville a rainfall of 3.56 inches in four hours flooded basements and blocked street car and interurban traffic.

July 13.—Two residences were damaged and a girl shocked into unconsciousness by lightning at Somerset.

July 18.—Near Pine Grove, Fayette County, two farm hands were killed by lightning in the open field. Wind damaged buildings and lightning burned a garage at Louisville.

July 25.—Two barns were destroyed by wind and three mules killed by lightning near Sacramento, McClean County. Trees

Daily Precipitation for July, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

†, Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indented as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

and buildings were damaged by wind, and lightning killed 4 horses, destroyed a barn, damaged two residences, and stunned one person in Daviess County. Wire systems were also damaged.

July 27.—Trees were blown down, several buildings unroofed, and two persons shocked by lightning during a storm at Louisville. Considerable fruit was blown off the trees.

July 29.—A man was severely injured, many head of valuable stock was killed, several large tobacco barns were destroyed by lightning in Graves County.

July 30.—A garage and barn were burned by lightning near Louisville.

Rivers.—Stages were low in all streams of the State during the month, and so low as to interfere with navigation in the upper Ohio River.

Daily Temperatures for July, 1922.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., AUGUST, 1922. No. 8

GENERAL SUMMARY.

Except for a short period of abnormally warm weather near the middle of the month, temperatures were generally moderate. Drought, already persistent in the northeastern counties, spread over the central and western districts, until more than half of the State was included in the dry area. Heavy rains in the eastern and south-central counties during the last week relieved the drought in those sections; but the light to moderate showers in other districts had only a temporary effect on vegetation. Because of the uneven distribution of rainfall, the condition of early crops varied greatly in the different parts of the State, ranging from poor in the dry northeastern and western hills to good in the south-central counties. In some localities corn "fired" up to the ear. Early tobacco failed to spread and "fired" so badly that it became necessary to cut it to save it. Premature cutting of tobacco in this condition, especially in the burley district, proceeded rapidly after the first week, with weather favorable for housing and curing. Early corn matured and was generally good outside the areas of severe drought; but in the dry districts the yield of corn, as well as of early tobacco, was materially reduced. Late corn, tobacco, and potatoes grew slowly in most of the State, because of insufficient moisture. These crops were much improved by the rains late in the month. The drought shortened the fourth crop of alfalfa, and seriously damaged cow peas. In the hilly section pastures became very short, making it necessary to begin feeding in places. They were revived in the eastern counties by the late rains, which also replenished stock water in that district. Much young clover was killed by drought. Dry soil prevented any progress with fall plowing.

TEMPERATURE.

The temperature for the State, 40 stations reporting, averaged 75.2°, which is 0.5° below normal. Minimum temperatures were low, ranging generally from 50° to 60°, in the periods 9-12th and 26-29th; also at many stations on other dates. Maximum temperatures ranged from 90° to 100° in the period 13-19th, and in the western counties during the first week. The daily range in temperature was unusually large. The extremes were 101° at Earlington on the 18th, and 47° at Farmers on the 28th.

PRECIPITATION.

The average precipitation for the State, based on reports from 55 stations, was 2.43 inches, which is 1.13 inches below normal. Moderate to heavy showers occurred generally in the western counties from the 22d to 24th, and in the central and eastern districts from the 23d to 26th; otherwise the only precipitation consisted of scattered local showers. In the south-central counties, upper Cumberland and upper Licking valleys, monthly amounts ranged between 4.0 and 6.0 inches; but in most of the northern, central, and western districts they varied from 0.6 inch to 3.0 inches. Amounts at the various stations ranged between 0.61 inch at Cloverport and 5.82 inches at Bowling Green. Thunderstorms were frequent, and often accompanied by hail and destructive winds.

MISCELLANEOUS

Aug. 1.—Three buildings were burned by lightning, and crops were damaged by hail in southern Christian County.

Aug. 2.—Lightning destroyed a large tobacco barn near Horse Cave, with a loss estimated at $20,000.

All temperature data are taken from self-registering thermometers.
The departure from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining extremes or division means.
Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.
§ Also on other dates. ** Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
¶ Post-office address, Covington, Ky. *Temperature data by Evening Sun.

Aug. 3.—A man was killed by lightning near Exie, Green County. A barn was burned by lightning near Pilot Knob.

Aug. 6.—Hail damaged crops in Scott and Mason counties. Wind wrecked several buildings and lightning burned three barns in Mason County.

Aug. 16.—A woman was killed by lightning near Livermore, while removing cloth strung on a wire fence.

Aug. 23.—A windstorm that caused damage estimated at $50,000 in Jeffersonville, Ind., crossed the Ohio River at Towhead Island and damaged buildings and other property to the extent of $100,000 in eastern Louisville. One person was killed and 13 injured in Louisville. Windstorms in Shelby and Henry counties destroyed 50 or more silos and tobacco barns, the latter containing a part of the new crop, with losses estimated at $500,000. Three persons were injured at Eminence, where the damage by wind was probably $100,000. Many barns and silos were destroyed and growing crops damaged in a windstorm in Mason County, with a loss estimated at $50,000. A heavy rain at Campbellsville washed out bridges, swept away several houses, drowned livestock, and damaged crops. Most

Daily Precipitation for August, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

[1] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. • Precipitation included in the next following measurement.

[2] Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland

T Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

of the bridges on the L. & N. Railroad between Campbellsville and Greensburg were washed out. Losses were estimated at $200,000. Heavy hail damaged tobacco and wind destroyed 12 barns in Henderson County, with a loss estimated at $100,000. Hail also caused some damage to crops in Boyle and Mercer counties. Wind damaged trees and wire systems at Danville.

Two persons were killed and one injured near Springfield when lightning struck a barn in which they had taken refuge, and a boy was killed at Beattyville when his home was struck and burned. Several persons near Springfield and one near Christiansburg were shocked by lightning.

River:— All streams were low during the month.

Daily Temperatures for August, 1922.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., SEPTEMBER, 1922. No. 9

GENERAL SUMMARY.

Weather conditions during the month were characterized by high temperature and generally deficient precipitation. The climatic contrasts of previous months persisted, but were to some extent reversed. The northeastern counties were visited early in the month by good rains, which broke the drought and caused marked improvement in late crops. Favored later in the month by further rains, which also reached other parts of the State, this district produced fair to good crops of late corn, tobacco and potatoes. Drought continued during the first three weeks in the central and western counties, retarding growth and causing premature harvesting of corn and tobacco. In this district pastures and late potatoes were temporarily improved by the late rains; but the dry, hot weather of the last decade soon checked growth. Potatoes practically failed in most of this area. Corn and tobacco on hilly upland "fired" badly, and had generally been harvested by the end of the month; but a considerable acreage of both crops was still uncut in the northern and eastern counties, where conditions of growth were better. Excellent quality of grain was assured by the quick drying of early corn in shock. The rapid curing of early tobacco improved the color and quality of that which was not fully ripe when cut. The weather was exceptionally favorable for harvesting cowpea and alfalfa hay, although it caused light yields. The quality of this late hay was much better than usual. A beginning was made in fall plowing, following the rains late in the month, and some rye was sown for a cover crop; but the moisture did not penetrate deeply and in a few days the soil was again so dry and hard it could not be worked. Some grain died soon after sprouting. Pastures continued poor in most sections, and stock water was generally short in the hilly region. Conditions were favorable for packing and marketing fruit.

TEMPERATURE.

The temperature for the State, 41 stations reporting, averaged 72.7°, which is 2.7° above normal. Maximum temperatures ranging from 90° to 100° occurred daily during the first decade, which was the warmest ten days of the summer. Day temperatures were frequently high during the remainder of the month, but the nights were generally cool and the daily range large. The extremes were 103° on the 6th and 7th at Hopkinsville, and 39° on the 26th at Farmers.

PRECIPITATION.

The average precipitation for the State, based on reports from 55 stations, was 2.22 inches, which is 0.54 inch below normal. Moderate to heavy rains occurred in the northeastern counties, and scattered showers in other districts, in the period 1st-5th. Rain occurred fairly generally, but varying greatly in amount, during the periods 10-11th and 19th-21st; also as scattered showers during the last three days. As in the preceding months of this growing season, the distribution over the State was remarkably irregular, frequently varying as much as 2.0 to 4.0 inches in adjoining counties. Small areas, each including a few counties, in the central blue grass section, in the lower Kentucky and middle Green river basins, and near the lower Cumberland, received from 3.0 to 6.0 inches. In other districts monthly amounts were generally between 1.0 and 3.0 inches, and in a few localities were less than 1.0 inch. Amounts at the various stations ranged between 0.60 inch at Farmers and 5.99 inches at Lexington. Thunderstorms were frequent, and more damaging than usual in this month.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, b, †, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Received too late to be included in means and summaries. f Precipitation is less than 0.01 inch rain or melted snow.
¶ Post-office address, Covington, Ky. *Temperature data by Evening Sun.

MISCELLANEOUS

September 4. — A man and wife were killed by lightning at Middlesboro, while on the porch of their home. Two other persons inside the house were severely shocked.

September 20. — A building was destroyed and another damaged by lightning at Louisville, with a loss estimated at $25,000. A residence and stable were damaged by lightning at Bowling Green. A horse in the stable was killed. Hail destroyed crops in a small area including portions of several farms southwest of Bowling Green.

September 25. — Tobacco was damaged by hail near Leitchfield.

September 26. — Crops were damaged by hail near Williamsburg.

September 29. — A tank of oil was burned by lightning near Bowling Green.

Rivers. — All streams of the State, including the Ohio, were unusually low during the month.

Daily Precipitation for September, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight

Daily Temperatures for September, 1922.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., OCTOBER, 1922. No. 10

GENERAL SUMMARY.

Warm weather during the first week was favorable for saving the late crops of corn, tobacco, and cowpea hay. This was followed by an unseasonably cool week, during which heavy frosts that practically ended the growing season occurred generally over the State; but without damage to the staple crops, most of which had been harvested.

A marked deficiency in precipitation in nearly all districts interfered seriously with the preparation of the soil and seeding, and resulted in a reduction of the acreage sown to wheat. A satisfactory seed bed could not be prepared because of the extreme dryness of the soil, hence most grain was sown under conditions more or less unfavorable for germination and growth. Showers during the second week were decidedly helpful, causing fairly good germination of the early sown wheat; but much of that sown after the middle of the month either failed to sprout or sprouted and then died. Most of the timothy sown in September perished.

The rapid and thorough drying of corn permitted gathering to begin earlier than usual, this work being well under way by the end of the month. Pastures continued poor and feeding was necessary; but good late pasturage was obtained from early sown rye, which is being more generally used for this purpose. Although showers started the grass at times, the moisture was never sufficient to keep it growing for more than a few days. Shortage of water for stock, and even for domestic purposes, became acute in the hilly districts. The dry weather diminished the yields of all late crops, potatoes being especially poor; but it was favorable for curing tobacco without damage, and for gathering and marketing the large crop of fruit.

TEMPERATURE.

The average temperature for the month, 39 stations reporting, was 60.1°, which is 2.3° above normal. Maximum temperatures during the first week ranged from 80° to 90°, and daily departures from 5° to 15° above normal. Short periods of warm and cool weather alternated for the next two weeks, followed by another period of unseasonably high temperature near the close of the month. Except on a few days, minimum temperatures were generally high for this month. The extremes were 96° at Hopkinsville on the 3d, and at Berea on the 5th; and 25° at Greensburg on the 19th.

PRECIPITATION.

The average precipitation for the State, based on reports from 54 stations, was 2.20 inches, which is 0.30 inch below normal. Showers occurred generally over the State in the period 7-11th, and locally on the 16th, 17th and 23d. As in previous months, distribution over the State was irregular, varying greatly in adjoining districts. A few restricted areas in the western counties and the upper Licking basin received slightly more than the normal amount; but other districts in the basins of the Green, Kentucky, and lower Licking reported only about half the normal rainfall for this month. In the central and extreme northern counties amounts ranged between 1.0 and 2.0 inches at most stations; and in the northeastern counties between 2.0 and 3.0 inches. Monthly amounts varied between 0.76 inches at Berea, and 4.41 inches at Blandville. Thunderstorms occurred on the 10th and 23d.

MISCELLANEOUS

Rivers:—All streams of the State, including the Ohio, were very low during the month. Navigation in the Ohio River was seriously impeded, and in some sections had to be suspended.

A ..... temperature data are taken from self-registering thermometers.

Temperature data, mean, temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published.

Dashes indicate omission or defective records.

Reference letters, ', ", * appearing in the table indicate number of days missing; for example, 2 represents two days, etc.

† Also on some other dates. ‡ Received too late to be included in means and summaries. ° Precipitation is less than 0.01 inch; rain or melted snow.

¶ Postoffice address, Covington, Ky. *Temperature data by Evening Sun.

Daily Precipitation for October, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

Daily Temperatures for October, 1922.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVI. LOUISVILLE, KY., NOVEMBER, 1922. No. 11

GENERAL SUMMARY.

The deficiency in precipitation, a continuation of similar conditions during the preceding three months, resulted in one of the worst fall droughts ever experienced in this State. The shortage of water, already acute at the beginning of the month, became serious in the central and eastern counties, where farmers were compelled to haul water several miles for domestic purposes. Stock had to be driven long distances and suffered greatly for water. The reservoirs that furnished the water supply of some of the towns in the east-central district dried up, and it became necessary to lay pipe lines a distance of several miles to large streams in order to obtain water. Much timber was destroyed by extensive forest fires that burned throughout the month in the eastern mountain region. Drilling operations in the oil fields practically ceased from lack of water.

Dry, warm weather during the first and second weeks favored the gathering and cribbing of corn; but delayed seeding and germination. Good showers during the third week moistened the soil for a few inches and caused the late sown grain to sprout; but the low temperature that followed during the last decade checked growth so that wheat continued to develop slowly and the plants remained undersized. These rains also relieved temporarily the shortage of water. Tobacco could be handled on a few days near the middle of the month, otherwise no progress was made with stripping. Pastures were generally non-productive. They improved slightly after the showers, but growth was soon checked by the low temperature. Corn gathering had been nearly completed by the end of the month. It was cribbed in excellent condition, the ears being unusually dry and sound.

TEMPERATURE.

The average temperature for the month, 40 stations reporting, was 48.3°, which is 2.2° above normal. Maximum temperatures ranging from 65° to 80° occurred almost daily during the first two weeks, while minimum temperatures in the same period rarely fell to freezing. After the 20th temperatures averaged generally below normal, and minima ranged from freezing to 10°. The extremes were 87° on the 1st at Hopkinsville, and 10° on the 26th at Junction City.

PRECIPITATION.

The average precipitation for the State, based on reports from 55 stations, was 1.93 inches, which is 1.42 inches below normal. Light scattered showers occurred on the 1st, 6th, and 27th; and moderate to heavy showers in the period 14-18th. In the middle basin of the Green River, and a few other western counties, amounts ranged between 3.0 and 4.0 inches; but in the central and eastern districts only 0.7 inch to 2.0 inches occurred. In most of the mountain and blue grass region, less than 1.5 inches were received. Monthly amounts varied between 0.73 inch at Shelbyville and 4.55 inches at Bowling Green. Snowfall ranged from 0.5 inch to 4.0 inches at stations in the northern counties. Thunderstorms were reported from a few stations on the 6th.

MISCELLANEOUS

November 26.—A slight earthquake shock was felt in several of the western counties about 9:30 p. m.

Rivers:—The Ohio River, and its tributary streams in this State, continued very low during the month. Navigation in the Ohio was practically suspended, except when carried on by means of artificial waves.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
T Precipitation is less than 0.01 inch rain or melted snow.
* Also on other dates. ** Received too late to be included in means and summaries.
¶ Post-office address, Covington, Ky. *Temperature data by Evening Sun.

Daily Precipitation for November, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

[] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. *Precipitation included in the next following measurement.

‡Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

Daily Temperatures for November, 1922.

VOL. XXVI. LOUISVILLE, KY., DECEMBER, 1922. No. 12

GENERAL SUMMARY.

Unseasonably warm weather during the first eight days, that caused renewed growth of grass and winter grains, was followed by a cold period of about equal length in which development ceased and vegetation became dormant. The hard freezes had some heaving effect on wheat and young timothy where the soil was wet, but these crops on well drained land were not injured. Warm weather also prevailed during the last decade, but freezing temperatures at night prevented growth. In the blue grass region pastures improved slowly until the cold weather set in, and furnished considerable grazing throughout the month. The prevailing mild weather, without snowfall of consequence, made the month especially favorable for stock outdoors; which passed through this part of the winter with only moderate feeding.

Precipitation averaged above normal for the first time in five months. Heavy rains about the 4th overcame the water shortage that had persisted throughout the late summer and fall. Ponds, cisterns, and small streams were filled; but springs did not resume their usual flow until late in the month. The gathering of shocked corn, delayed by dry weather in November, was generally completed during the first two weeks. The warm and rather frequent rains supplied the conditions necessary for handling tobacco. Although stripping had scarcely begun at the first of the month, it was approaching completion on many farms toward the close; while exceptional progress was made in marketing the crop. Dirt roads deteriorated, but highways remained in good condition.

TEMPERATURE.

The average temperature for the month, 41 stations reporting, was 41.5°, which is 4.4° above normal. Maximum temperatures in the periods, 1st-8th and 24-27th ranged from 60° to 70°; while minimum temperatures seldom fell below freezing. There were two periods of severe freezes, 12-13th and 18th-21st, when the lowest temperature ranged between 10° and 20° at most stations. The extremes were 77° on the 8th at Williamsburg, and 5° on the 19th at Williamstown.

PRECIPITATION.

The average precipitation for the State, based on reports from 55 stations, was 5.64 inches, which is 1.70 inches above normal. Moderate rains occurred in the periods, 1st-10th, 14-17th, 27-28th, and 31st. The rainfall was heavy at many stations on the 4th, 7th, 17th, and 28th, especially in the central and eastern counties. In the district near the Ohio River precipitation ranged between 4.0 and 6.0 inches, and increased generally toward the southern and eastern boundaries; reaching 8.0 to 9.0 inches in the upper Cumberland basin. Monthly amounts varied between 3.79 inches at Cloverport and 9.30 inches at Middlesboro. Except in the northeastern counties, where from 1.0 to 2.0 inches occurred, snowfall was confined to a few flurries. Thunderstorms were reported on the 4th, 7th, and 8th.

MISCELLANEOUS.

Rivers:—The rains of the 4th caused a rise in the Ohio River that permitted the resumption of navigation. Other rises occurred near the middle and last of the month, furnishing good boating stages most of the time.

[a] Temperature data are taken from self-registering thermometers.

[b] Departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], appearing in the table indicate number of days missing; for example, b represents two days, etc.

[d] Also on other dates. [f] Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.

¶ Post office address, Covington, Ky. *Temperature data by Evening Sun.

Daily Precipitation for December, 1922.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVII. LOUISVILLE, KY., ANNUAL, 1922. No. 13

GENERAL SUMMARY.

The mean temperature for the year was the second highest since State averages were established, being exceeded only by the record average temperature of 60.1° for 1921. The months of February, March, April, May, September, October, and November were unseasonably warm; while temperatures for the other months averaged near normal. The April freezes were less severe than usual, and most of the fruit escaped damage. No weather sufficiently cold to seriously check growth occurred until early in December. This condition was favorable for late wheat, because much of it failed to germinate until November. Precipitation for the year was somewhat less than normal. It was comparatively heavy in the spring months; but was so deficient during the period, August to November, inclusive, as to cause one of the worst fall droughts ever experienced in this State. The situation in regard to water for stock and domestic use became decidedly serious in October and November; especially in the central and eastern counties, where small streams and some city reservoirs dried up. There was considerable loss from forest fires in the timber lands of the mountain section; and lack of water interfered with work in the oil fields. After the first week in May, no general rains occurred during the growing season. Precipitation was entirely in the form of local showers, which were distributed over the State with remarkable irregularity. Some favored districts, including a few counties, at times received too much rain; while other sections less than 50 miles distant suffered severely and continuously from drought. Heavy and frequent rains in March, April, and the first week in May seriously delayed preparation of soil and the planting of early potatoes. Later in May and in early June dry weather delayed the transplanting of tobacco and caused a reduction in acreage. The heat and drought of June damaged oats and early potatoes, but was favorable for harvest. Rains in July reached larger areas, relieving drought conditions locally; but were still insufficient in much of the State, particularly the northeastern counties. Corn and tobacco "fired" badly in large districts, with material reduction in yields. The quality of tobacco was improved, however, by the ideal weather for rapid and perfect curing. On account of the failure of pastures, which dried up in August and continued poor during the remainder of the season; a larger acreage of rye than usual was sown early for grazing, while there was still sufficient moisture to give it a start. Late potatoes made a poor crop. Late cutting of alfalfa and cowpeas were reduced; but the loss in yield was offset to some extent by the excellent quality of hay. Corn matured prematurely, dried out unusually early, and was gathered without damage by wet weather. Fall plowing and seeding were difficult, because of the extreme dryness of the soil. On account of delayed germination, most wheat was small in size when growth was checked by freezing weather in December. Streams became very low and continued in this condition, with almost complete suspension of navigation, until good rains occurred early in December.

THE WEATHER BY MONTHS

JANUARY.—The temperature was variable, with a few periods of quite severe weather. Wheat was well rooted and suffered little from the frequent freezes and thaws. This was also due in part to the light precipitation, which averaged about half of the normal amount. There was no snow cover of consequence.

FEBRUARY.—Mild weather predominated; causing premature growth of fruit buds, wheat, and grass, which was checked by low temperature late in the month. Although precipitation averaged near normal, most of it occurred on a few days in the last decade, resulting in floods in headwater streams.

MARCH.—Cold weather early in the month was beneficial in delaying the budding of fruit. Unseasonably mild weather prevailed during the last three weeks, and early vegetation was advanced fully three weeks ahead of the season. The exceptionally heavy and frequent precipitation prevented any progress of consequence in plowing, sowing oats, or planting potatoes. Floods caused much damage to crops on lowlands, and to roads, bridges, and fences along streams.

APRIL.—Unseasonably warm weather during the first half caused rapid growth. Heavy frosts on the 23d injured tender vegetables, but caused no other damage of consequence. Frequent rains delayed plowing and planting, and injured fruit by washing away the pollen. The full acreage of oats and potatoes could not be planted.

MAY.—Weather conditions were generally favorable for plowing and seeding. Although planted somewhat late, corn germinated quickly because of the excess warmth, and made seasonal advancement. The local character of the rainfall during the last half of the month delayed somewhat the transplanting of tobacco. Clover and alfalfa were cured and put up in good condition.

JUNE.—High temperature and a marked deficiency in rainfall caused drought to become well defined in large districts. Wheat and rye ripened prematurely, without complete filling. Much

All temperature data are taken from self-registering thermometers.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents 2 days, etc.
† Also on other dates. *Also in November.

late tobacco could not be set. Harvest was earlier than usual, followed quickly by thrashing. Early corn and tobacco grew well but late crops started badly. Oats and early potatoes practically failed in the driest districts.

JULY.—Moderate temperature and heavy local showers were decidedly beneficial; but drouth conditions persisted in large districts. Corn and tobacco made good progress in most of the southern and western counties, but "fired" and grew unevenly in other districts. Rainfall diminished toward the end of the month, and areas affected by drouth were considerably extended.

AUGUST.—Drought conditions spread rapidly over the central and western counties. In some districts corn "fired" up to the ear, and tobacco had to be cut in order to save it. Late corn, tobacco, and potatoes grew slowly because of insufficient moisture. Early corn and tobacco did well in some western and south-central counties, where local rains occured; but in general all crops suffered and deteriorated.

SEPTEMBER.—High temperature and deficient precipitation characterized weather conditions. Premature cutting of corn and tobacco continued. Showers revived late crops for a few days, but were not sufficient to keep them growing. Tobacco in barns and corn in shock dried rapidly, without damage. Some rye, sown early for a cover crop, died soon after sprouting.

OCTOBER.—The first week was warm and favorable for saving the late crops. Heavy frosts during the second week ended the growing season, but caused no damage. Wheat was sown under unfavorable conditions for germination and growth, because the soil was so dry that a satisfactory seed bed could not be pre-

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

T Precipitation is less than 0.01 inch rain or melted snow.

pared. Corn dried quickly and gathering began earlier than usual. Most of the timothy that had been sown in September perished.

NOVEMBER.—Seeding and germination were further delayed by dry weather. Rains late in the month sprouted the late sown grain, but the cooler weather that followed prevented much growth. Most of the corn crop was gathered. The water shortage became so acute that some cities in the central and eastern counties were compelled to lay pipe lines several miles to large streams in order to obtain water.

DECEMBER.—Rains early in the month relieved the water shortage and temporarily filled the streams. They also made possible the handling of tobacco. Low temperatures during the second week stopped the growth of grains, but caused no injury of consequence. Mild weather predominated, and stock fared well outdoors.

Monthly and Annual Mean Temperatures for the Year 1922, with Departures from the Normal.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVIII. LOUISVILLE, KY., JANUARY, 1923. No. 1

GENERAL SUMMARY.

Except on a few days which were only moderately cold, mild weather prevailed throughout the month, becoming warmer toward the close. Mean daily temperatures ranged from normal to 20° above; while the average temperature for the month was exceeded only in January, 1907, 1913, and 1916. Freezing temperatures, occurring frequently at night, held vegetation in restraint during the first three weeks; but marked indications of growth appeared in grass, wheat, rye, and certain trees and shrubs during the last few days, when spring-like conditions prevailed.

Although the temperature was favorable, the light precipitation and frequent dry, brisk winds in the first two weeks delayed somewhat the handling of tobacco. Heavy rain set in on the 20th, and continued at intervals until the end of the month. Excellent progress was made with stripping tobacco during this period; but deliveries were delayed by the condition of the dirt roads, which became rapidly worse after the rains began. Improved highways also deteriorated and were damaged by washing. Bottom lands along the Green, Barren and Salt Rivers, and along other smaller streams in the Central and western counties, were extensively flooded, with considerable damage to fences, buildings, and wheat. Roads in Graves and McCracken counties were rendered impassable by the washing out of bridges on the 20th. Although the soil was watersoaked, what freezes occurred caused no injury of consequence to wheat and rye, which continued in good condition. Stock fared well in the open, with moderate feeding.

TEMPERATURE.

The average temperature for the month, 41 stations reporting, was 41.0°, which is 5.8° above normal. Maximum temperatures between 50° and 60° occurred on most days in all districts; while minimum temperatures near freezing, or a few degrees below, were the rule. Moderately low temperatures were recorded generally on only two days, the 13th and 17th. The extremes were 68° at Franklin on the 11th and at Mayfield on the 31st, and 11° at Berea on the 17th.

PRECIPITATION.

The average precipitation for the State, based on the reports of 57 stations, was 6.11 inches, which is 1.72 inches above normal. Light scattered showers occurred during the first decade, and moderate rains in the period 14-15th. Beginning with the 20th rain occurred daily until the end of the month. Daily amounts were heavy generally on the 20th and 21st, and heavy locally on the 24th, 27th and 31st. In the northeastern counties, and the district near the Ohio River as far west as the mouth of the Green, monthly amounts ranged generally from 4.5 to 5.5 inches. In the central, southern and western districts, 6.0 to 8.0 inches were reported from most stations; while more than 8.5 inches occurred in the extreme southwestern part of the State. Flurries on a few days in the northern and eastern counties represented the total monthly snowfall. Thunderstorms were reported on the 7th, 14th, 20th, 30th, and 31st. Sleet occurred locally on the 7th, 9th, 21st, 22d, and 24th, and generally over the State on the 23d.

MISCELLANEOUS.

Rivers:—The Ohio River rose slowly after the 20th, reaching flood stage at Evansville on the 30th. On the Green a crest of 31.7 feet was reached at Brownsville on the 25th, and 41.3 feet at Woodbury on the 26th. The lower Green remained near or above flood stage from the 23d to the end of the month

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.

a Also on other dates. ** Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.

¶ Post office address, Covington, Ky. *Temperature data by Evening Sun.

Daily Precipitation for January, 1923.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

Daily Temperatures for January, 1923.

VOL. XXVIII. LOUISVILLE, KY., MARCH, 1923. No. 3

GENERAL SUMMARY.

The principal features of the month's weather were the frequent sharp changes in temperature, the two cold waves of midwinter severity, and the widespread and destructive windstorms of the 11-12th. Wintry conditions predominated, especially during the last two weeks. Scarcely anything could be done toward spring plowing, planting early potatoes, sowing oats, and planting early gardens, these activities being prevented until near the close of the month by the frequent heavy rains. The sowing of tobacco plant beds continued throughout the month in the intervals of favorable weather, and was finally completed about two weeks later than usual.

Much of the sprouting clover seed, probably 50 per cent of the amount then sown, was killed by the low temperature of the 19-20th; also peach buds suffered considerably in the southern counties. Additional damage of the same character resulted from the freeze of the 31st, which was nearly as severe and occurred when vegetation was somewhat farther advanced. The plants or germinating seed, in some of the earlier tobacco plant beds were killed at this time. The injury to fruit was less than usual from such severe conditions so late in March, because the frequent recurrence of freezing weather had retarded its development. Pastures on warm, south slopes made some growth, otherwise grass remained dormant as in winter, and heavy feeding of stock had to be continued. Early wheat was growing slowly and looked well at the beginning of the month, but it made no progress or deteriorated later; while the late sown portion of the crop was badly frozen out. Roads were either in a softened condition from rains and thaws, or were frozen rough most of the time.

TEMPERATURE.

The average temperature for the month, 40 stations reporting, was 45.6°, which is 0.4° below normal. The periods 1st-2d and 9-13th, also the 15th, 22d, and 25th, were moderately warm; while temperatures below normal prevailed in the periods 6-8th, 16-20th, 23d-24th, and 26th-31st. Minimum temperatures on the 19th, 20th, and 31st ranged between 10° and 20° at most stations. The difference in the mean temperatures at extreme northern and southern stations was considerably larger than usual for this month, amounting to 7°. Extremes at the various stations ranged between 8° at Blandville on the 19th and 80° at Williamsburg on the 3d.

PRECIPITATION.

The average precipitation for the month, based on reports from 56 stations, was 5.27 inches, which is 0.61 inch above normal. Heavy rains occurred generally in the periods, 6-7th, 10-12th, 16th, and 21st-24th. In the district near the Ohio and Big Sandy rivers, and in the bluegrass region, monthly amounts ranged between 3.0 and 5.0 inches. In the southern half of the State they varied generally between 5.0 and 8.0 inches, increasing toward the southern boundary. At the various stations the total for the month ranged between 2.70 inches at Marion and 8.02 inches at Hopkinsville. Snowfall was mostly confined to a few flurries at stations in the central and northern counties. Thunderstorms were reported on the 11th, 13th, 15th, 16th, 18th, and 23d; and hail from several stations on the 11th.

MISCELLANEOUS.

March 11-12.—Severe windstorms swept over most of the State during the night of the 11th and morning of the 12th, killing 10 persons, injuring 80, and causing damage estimated at [illegible] than $1,000,000. It was most serious in the following

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, †, ¶, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
¶Post-office address, Covington, Ky. *Temperature data by Evening Sun.

areas: Daviess County and bordering sections; Madison County and surrounding districts; and in a broad belt extending from Logan and Simpson Counties northeastward to the mouth of the Kentucky River. In these districts hundreds of barns and scores of dwellings were unroofed or demolished; while telephone, telegraph, and trolley services were generally paralyzed. The loss of live stock, especially cattle, was estimated at several hundred head. Extensive damage also occurred in the other portions of the State west of the mountain section, where windows, roofs, and wire systems suffered. Hail accompanied these storms in many localities. Some estimates of damage by counties in which the losses were greatest are as follows: Graves,

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

[] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

$75,000; Daviess, $500,000; Henderson, $200,000; McLean, $40,000; Nelson, $60,000; Montgomery, $25,000; Henry, $20,000; Shelby, $100,000; Clark $100,000; Fayette, $30,000; Larue, $100,000; Hopkins, $100,000; Warren, $100,000; Jefferson, including Louisville and vicinity, $200,000.

Rivers:—Moderately high stages prevailed in the Ohio River during most of the month. It was above flood stage at Evansville from the 14th to 24th, and at Cairo from the 18th to 22d. The Green was also high and frequently above flood stage below Woodbury from the 8th to 25th.

ERRATA: Daily precipitation at Falmouth for March 28, 1921 should be 3.39, instead of 0.39.

Daily Temperatures for March, 1923.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVIII. LOUISVILLE, KY., APRIL, 1923. No. 4

UNIVERSITY OF ILL. JUN 4

GENERAL SUMMARY.

During the first two weeks unseasonably cold weather, with frequent frosts, delayed growth, and heavy rains interfered seriously with farm work. Except on warm and well drained soils, pastures, meadows, tobacco plants, and early vegetables made scarcely any growth. Favorable weather after the 15th permitted rapid progress in sowing oats and planting potatoes, but the lateness of the season and pressure of other work caused a reduction in the acreage of these crops. Some corn was planted in the southern counties near the close of the month, but in the main this period of good weather was devoted to preparing the soil. Wheat did not look well at the beginning of the month, but improved steadily and most of the early sown was in fairly good condition at its close. Clover and alfalfa started slowly and became weedy in spots that had been winter killed. Although seriously delayed in time, plowing and planting kept pace with the development of vegetation, which was at least two weeks late.

Fruit trees blossomed very late, peaches, plums, and early pears about the second week; and apples, cherries, and strawberries during the last week. The light bloom of peaches indicated considerable injury from the March freezes, but most other fruits bloomed heavily and promised good crops. Tobacco plant beds, most of which had been frozen, were generally resown in the first week; but the germination was slow and the plants started to grow exceptionally late. In favorably located beds that escaped the freezes the plants were up early in the month. Much clover was reseeded during the first two weeks. The prevailing low temperature and ample moisture of the surface soil resulted in satisfactory germination and a good stand of this late sowing. The last killing frost occured generally over the State on the 18th.

TEMPERATURE.

The average temperature for the month, 40 stations reporting, was 54.8°, which is 1.1° below normal. Temperatures of freezing or lower occurred somewhere in the State on 10 or more of the first 18 days, but the dormant condition of vegetation precluded any damage of consequence. Brief spells of moderately warm weather alternated with short periods of abnormally low temperature until the 18th, after which conditions were more seasonable and daily mean temperatures were generally above normal. Extremes at the various stations ranged between 90° at Hopkinsville on the 22d and at Lone Oak on the 23d, and 13° at Beattyville and Farmers on the 1st.

PRECIPITATION.

The average precipitation for the month, based on reports from 55 stations, was 4.88 inches, which is 0.94 inch above normal. Light showers occurred on the 8th, light to moderate rains from the 3rd to 5th, and moderate to heavy rains in the periods, 12-14th and 27-29th. In a broad belt running northeast-southwest from Lewis and Greenup to Fulton and Hickman counties, the total precipitation ranged between 5.0 and 7.0 inches. Northwest of this district, near the Ohio River, amounts were near 4.0 inches; while to the southeast in the south-central counties and the mountain region they ranged between 3.0 and 4.5 inches. At the various stations monthly totals varied between 2.96 at Jackson, and 6.79 inches at Taylorsville. Snow flurries were reported from only two stations. Thunderstorms occurred on the 4th, 5th, 7th, 8th, 13th, 14th, 21st 23d, 27th and 28th.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing: for example, b represents two days, etc.
† Also on other dates. [f] Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
¶ Post-office address, Covington, Ky.

Daily Precipitation for April, 1923.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

Daily Temperatures for April, 1923.

§§ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

.. .. note indicate respectively 1, 2, 3 etc., days missing from record.

MISCELLANEOUS.

Rivers:—The Ohio declined to moderate stages from the 1st to 5th. A sharp rise followed the heavy rains of the 13th, continuing until the 18th, but flood stages were not reached at any station. It fell rapidly to moderate stages during the last decade. The middle and lower Green reached stages slightly under flood in the period, 15-19th.

VOL. XXVIII. LOUISVILLE, KY., MAY, 1923. No. 5

GENERAL SUMMARY.

Continued cold weather, lack of sunshine, and damaging frosts rendered the month decidedly unfavorable for the growth of most crops. For a period of three weeks daily mean temperatures were almost continuously below normal. Snow squalls, accompanied by temperatures near freezing, occurred in the northern counties during the afternoon and night of the 8th, and also on the 9th. Minimum temperatures ranging from 28° to 36° at most stations, with heavy frosts in the central and eastern districts, were reported on the morning of the 10th. Ice formed, even on upland, in the northeastern counties, where the frost was killing in many localities and vegetables and fruits were seriously injured. The damage from frost in other districts was confined mostly to tender vegetables such as beans, tomatoes, and potatoes, growing on low ground. Strawberries were damaged to some extent in the eastern half of the State, but the main berry producing areas in the western counties were not seriously affected. Wheat suffered no injury of consequence, and generally withstood the cool weather better than other crops. It improved steadily during the month, and began heading in the southern counties about the 20th.

Corn planting progressed rapidly during the first week, after which it was greatly delayed by wet weather in large areas in the southern and western counties, where the rainfall was excessive. As a rule bottom land in those districts had not been planted at the end of the month. Better progress was made with plowing and planting in the northeastern counties, where there was a marked deficiency in precipitation. The extraordinary contrast in the amount of rainfall received by nearby districts was one of the most striking features of the month's weather. Because of poor germination and unusual cut-worm activity, for which the cool weather was largely responsible, early corn required considerable replanting. Destruction of tobacco plantbeds by the worms was reported from the burley district. The low temperature seriously retarded the growth and maturing of bluegrass seed, and also greatly delayed the first cutting of alfalfa. Slow growth of tobacco plants delayed transplanting, which did not commence until near the end of the month. Oats, potatoes, and gardens made slow progress until the last week, when temperatures rose above normal. When the month closed the stage of development of the various crops remained at least two weeks behind the season.

TEMPERATURE.

The average temperature for the month, 40 stations reporting, was 63.9°, which is 1.7° below normal. Minimum temperatures ranging from 40° to 50° occurred almost daily from the 5th to 27th, falling to freezing or lower at many stations in the period 8-10th. Seasonable temperatures prevailed on the first four and the last four days. Extremes at the various stations ranged between 27° at Farmers on the 10th, and 91° at Farmers and Maysville on the 31st. This minimum equals the lowest reached in May during the 35 years of State records.

PRECIPITATION.

The average precipitation for the month, based on reports from 58 stations, was 3.98 inches, which is 0.03 inch above normal. Light to moderate showers occurred in the periods, 3d-5th, 8-9th, 11-12th, 20th-21st; and moderate to heavy rains in the periods 15-16th and 25th-31st. Excessive 24 hour amounts, that occurred on the 15th in the extreme western counties, caused considerable damage to land and roads by

State averages and extremes				63.9		91	31	27	10	48	3.98		5.45	T.	13	11	8	12	se.	

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Absent other dates. †† Received too late to be included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow.

¶ Post-office address, Covington, Ky.

wa-hing. Although the average precipitation was practically normal, the distribution over the State was remarkably irregular. In the northeastern counties amounts ranged from 1.4 to 3.0 inches, being lightest over the bluegrass region. Immediately south of this district an area consisting of a few counties received from 6.0 to 8.0 inches. In the west-central district amounts ranged from 3.0 to 5.0 inches, while in the extreme western counties the amounts varied between 6.0 and 10.0 inches. Monthly precipitation at all stations ranged between 1.45 inches at Cynthiana and 9.55 inches at Lone Oak, near Paducah. The snow of the 9-10th occurred as flurries generally over the northern half of the State, but the amount reached 1.0 inch in Kenton County. Sleet was reported from some stations in the eastern counties on the 9th. Thunderstorms occurred frequently during the second and last week.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

MISCELLANEOUS.

May 27.—At Louisville lightning damaged a church slightly, caused a loss estimated at $40,000 to a residence, and shocked several persons.

Rivers:—A moderate rise in the Ohio, beginning in the upper reaches on the 13th and ending in the lower river about the 21st, was followed by a steady decline that continued during the remainder of the month.

Daily Temperatures for May, 1923.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVIII. LOUISVILLE, KY., JUNE, 1923. No. 6

GENERAL SUMMARY.

Although the temperature for the month averaged near normal, it was characterized by sharply defined periods of decidedly warm and unseasonably cool weather. High temperatures during the last days of May and the first week of June caused rapid growth, especially of corn, which was not appreciably checked by the cool weather that followed. Persistent rains during the first two weeks in the western and southern counties greatly delayed corn planting and the cultivation of early crops. Early corn became very weedy, and remained in that condition when its tillage ceased near the end of the month. The wet weather had the effect of crowding this work into the period of harvest, with the result that the proper attention could not be given to the early crops. In the northeastern counties, which received much less rain, cultivation was timely and satisfactory. Frequent heavy rains during the second week caused considerable soil erosion. In many localities corn was washed out of the furrows, and wheat was damaged by lodging or falling.

Tobacco setting was practically completed by the 15th, the rainy weather and low temperature being decidedly favorable for obtaining a good stand. Its growth was satisfactory, but its cultivation was delayed by the pressure of other work. Despite the continued rains but little rust appeared on wheat. The dry, hot weather after the 17th improved the quality of the grain, accelerated ripening, and furnished ideal conditions for harvest, which was completed without delay. Much difficulty was experienced in cutting and curing the first crop of alfalfa. Delay in removing the first crop, due to wet weather, also delayed and reduced the second crop. On many farms this will cause the loss of one cutting during the season. At first rain interfered with gathering bluegrass seed, but the work was finished under favorable conditions. Potatoes, oats, gardens, and truck crops improved steadily. Oats headed well, with straw of fair length, and were being harvested when the month closed. Timothy meadows improved, but headed short and became weedy. Much clover was not cut because of the predominance of weeds. In growth and development of crops there was a decided gain over the conditions that existed at the beginning of the month, but cultivation remained seriously behind in a large part of the State.

TEMPERATURE.

The average temperature for the month, 41 stations reporting, was 73.8°, which is 0.1° above normal. There were two well defined periods of high temperature, the 1st-7th and 17-26th; and two of low temperature, the 8-15th, and 28-30th. Minimum temperatures below 50° were registered at many stations on the 29th and 30th. An unusual feature was the absence of high temperatures in the western counties, which are usually the warmest, and their frequency in the northeastern district, which is generally the coolest part of the State. Extremes at the various stations were 99° at Bowling Green and Maysville on the 22d, and 42° at Greensburg on the 30th.

PRECIPITATION.

The average precipitation for the month, based on reports from 57 stations, was 4.59 inches, which is 0.41 inch above normal. Showers, varying from light to heavy, occurred in the period 5-7th, and moderate to heavy rains in the period 10-13th. Local showers were reported on the 15th and 16th, and from the 23d to 29th. As in the previous month there was marked irregularity in distribution over the State. In the northeastern counties, most of the southeastern section, and in the extreme

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
T Precipitation is less than 0.01 inch rain or melted snow.
* Also on other dates. † Received too late to be included in means and summaries
¶ Post-office address, Covington, Ky.

western district, monthly amounts ranged between 2.0 and 4.0 inches. In the basin of the upper Kentucky, and along the Ohio River from Campbell County to Henderson County, thence southward to the Tennessee line, they ranged between 5.0 and 9.0 inches. Monthly precipitation at all stations varied from 2.10 inches at Cynthiana to 8.98 inches at Jackson. Thunderstorms were frequent in the periods 5-15th and 23d-28th.

MISCELLANEOUS.

June 2.—A youth was reported killed by lightning which struck a tree in the yard of his home at Lamasco, Ky.

June 6.—Lightning struck two street cars at Louisville, badly burning a passenger on one and severely shocking the motorman on the other.

Daily Precipitation for June, 1923

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

June 15.—A heavy rain washed away buildings, fences, and livestock along Mulberry Creek, Shelby County.

June 19.—A death at Louisville was attributed to heat prostration.

June 27.—Many barns and outbuildings were blown down during a windstorm at Williamsburg.

Rivers:—Except for sharp rises in headwater streams and a moderate rise in the Ohio River, caused by the rains of the 11-12th, moderate stages prevailed during the month.

Daily Temperatures for June, 1923.

VOL. XXVIII. LOUISVILLE, KY., JULY, 1923. No. 7

GENERAL SUMMARY.

Sunshine much above normal and temperatures averaging near normal, with moderate maxima, were decidedly favorable for growth of the staple crops and for farm activities. Rain sufficient for the needs of vegetation occurred in the eastern half of the State, although its distribution over that district was quite irregular. In a considerable area lying east of Jefferson County, rain interfered with thrashing during the first two weeks, otherwise this work has proceeded without delay and had been completed in the more accessible districts by the end of the month. Yields of wheat were fair to good, and of oats poor to fair; while the quality of grain was good to excellent on account of its thoroughly dry condition. In the southeastern counties cultivation was delayed by heavy rains during the first week, but the weather was satisfactory for this work in other sections. In the western counties the deficiency in rainfall became more pronounced as the month advanced, and indications of drought appeared in the hilly districts, where early corn began to "fire" and the growth of of late corn and tobacco was retarded. Except in the middle western counties during the last two weeks, corn grew rapidly making further gains that placed the early plantings practically abreast of the season. Early corn tasselled and silked with soil moisture and temperature generally suitable for fertilization. The weather was favorable for the growth and cultivation of tobacco in the burley district, where the crop made seasonal advancement. Topping began during the second week. Rain was needed in the dark district to cause the plants to spread. Pastures continued good in the bluegrass region, but they steadily declined in other sections, becoming quite short and badly dried in the western hilly district. Timothy hay harvest was completed, and the second crop of alfalfa was cut, with conditions generally ideal for curing. Much baling of hay was done in the fields. Early potatoes were dug and marketed without serious hindrance by adverse weather. Planting of the late crop proceeded satisfactorily in the east, but was hampered in the west by dry soil. Gardens and truck crops continued good, but suffered for rain in the western counties. Blackberries were plentiful where precipitation reached or exceeded the normal amount.

TEMPERATURE.

The average temperature for the month, 41 stations reporting, was 76.8°, which was 0.1° above normal. The spell of cool weather at the close of the preceding month continued through the first three days of July, after which there was little variation in temperature. Maximum temperatures were moderate and remarkably uniform, registering from 90° to 95° daily in the period 4—27th. Extremes at the various stations ranged between 99° at Bowling Green on the 15th, at Greenville and Lone Oak on the 24th, and 44° at Eubank on the 1st.

PRECIPITATION.

The average precipitation for the month, based on reports from 57 stations, was 3.59 inches, which is 0.71 inch below normal. The distribution over the State was remarkably irregular. In the western half of the State amounts for the month ranged generally from 2.00 to 3.50 inches, although several stations in the basin of the lower Green and westward reported less than 1.00 inch. There was also a marked deficiency in the northern bluegrass region, where amounts ranged between 1.50 and 2.25 inches. In other eastern districts, and from the Salt River basin northward, precipitation varied greatly but was generally above normal and between 4.00 and 6.00 inches at

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [b], [4], appearing in the table indicate number of days missing; for example, b represents two days, etc.
T Precipitation is less than 0.01 inch rain or melted snow.
† Also on other dates. †† Received too late to be included in means and summaries
¶Post-office address, Covington, Ky.

most stations. Amounts at all stations ranged between 0.21 inch at Marion and 7.79 inches at Anchorage. Scattered showers in the extreme western counties, and moderate to heavy rains in the central and eastern districts, occurred in the period 6-8th. Showers occurred locally on the 12-13th, 16-17th, 23d-25th, 28-29th, and 31st. Thunderstorms were reported on 19 days, and were frequently accompanied by destructive lightning

MISCELLANEOUS.

July 5.—A farmer was killed by lightning in an open field near Harrodsburg.

July 13.—A heavy local rain caused extensive damage to crops and buildings along Lick Creek, Carroll County. A woman was badly burned by lightning in Owen County.

July 24.—One man was killed and another injured by lightning while swimming in the Ohio River near Dayton, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

| Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

July 27.—Two thoroughbred horses, valued at $2000, were killed by lightning near Lexington. Residences at Fulton were flooded by a heavy local rain.

July 31.—A farmer was killed by lightning in an open field near Richmond, Ky. One man was killed and another stunned by lightning while taking shelter under an oak near Drennon Springs.

Rivers:—Stages were moderate to low during the month.

Daily Temperatures for July, 1923.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

UNIVERSITY OF ILLINOIS LIBRARY

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVIII. LOUISVILLE, KY., AUGUST, 1923. No. 8

GENERAL SUMMARY.

Although the temperature averaged near normal, decidedly warm weather prevailed during the first two weeks and unseasonably cool weather in the decade following the 15th. Precipitation presented marked contrasts in areal distribution, ranging from less than normal at some eastern stations to three or four times the normal amount in some western localities. In the north-central and most of the eastern counties, including the burley tobacco district, the month was relatively dry and favorable for outdoor activities. Early crops matured rapidly, and late crops of corn, tobacco, alfalfa, cowpeas, and potatoes, made satisfactory growth. Early tobacco matured an excellent crop, practically free from rust; and cutting was well advanced in that section by the end of the month. In the western counties rains early in the month, following incipient drought, caused rapid improvement in crops during the first two weeks; but persistent and excessive downpours later on kept the soil in such a saturated condition that much corn, tobacco, and potatoes growing on low or flat land were drowned out and the growth of upland crops was retarded. Despite the excessive rains, however, crops on well drained soils were generally good in that district. The wet weather was favorable for the spread of tobacco rust, which appeared locally during the third week, but a period of dry and relatively calm days, with abundant sunshine, immediately after its appearance kept the disease localized, and little damage resulted. Because of more favorable weather conditions for growth and ripening, tobacco matured more rapidly and cutting was farther advanced in the burley than in the dark district. Pastures and young clover improved during the first two weeks and continued in much better condition than usual at this time of year. Gardens also improved in the northern and eastern districts, but the excessive rains damaged them seriously in the southern and western counties. Late potatoes came up somewhat irregularly in the wet district, but the stand and growth were generally satisfactory in the north-central and eastern sections devoted to this crop. Second crop clover made few seed in the wet area, but developed well in the eastern counties.

TEMPERATURE.

The average temperature for the month, 41 stations reporting, was 75.4°, which is 0.3° below normal. Mean daily temperatures were above normal almost continuously from the 1st to 15th, but were considerably below normal in the periods, 16-18th and 22d-25th. On the 23d and 24th, the coolest days, minimum temperatures ranged between 43° and 55° at most stations. The extremes for the month were 99° on the 12th at Lone Oak and 43° on the 24th at Eubank and Junction City.

PRECIPITATION.

The average precipitation for the State, based on reports from 57 stations, was 6.03 inches, which is 2.47 inches in excess of normal. Showers occurred daily, attended in most cases by thunder, in the periods, 1st-18th and 25-30th. The rainfall was moderate to excessive in most districts on the 4th, 5th, 17th, and 22d; also locally on the 7th, 9th, and 13th. The distribution over the State showed two well defined districts, one of moderate and another of excessive rainfall. The first included most of the north-central and eastern counties, where amounts ranged generally between 2.25 and 5.00 inches; while the other included most of the western half of the State in which the amounts ranged between 6.00 and 12.00 inches at most stations. The total precipitation at all stations varied between 2.17 inches at Anchorage and 12.77 inches at Calhoun.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
† Also on other dates. †† Received too late to be included in means and summaries
T. Precipitation is less than 0.01 inch rain or melted snow.
¶ Post-office address, Covington, Ky.

MISCELLANEOUS.

August 4.—Heavy rains damaged crops by washing in the vicinity of Hopkinsville.

August 5.—A man was killed by lightning while sitting inside a building at Central City.

August 12.—A windstorm caused damage to trees, light buildings, telephone, telegraph and trolley lines at Louisville. In Nelson County a boy was fatally and six other persons more or less seriously injured when a tree was blown across the automobile in which they were riding. Four cows were killed and a young man was severely shocked by lightning near Harrodsburg. A death from heat prostration occurred at Louisville.

August 14,—Heat prostration caused the death of a laborer at Owensboro.

August 16.—A barn was destroyed by lightning near Owensboro.

Daily Precipitation for August, 1923

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

( ) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

; Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky (S) Salt; (G) Green (C) Cumberland

T Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

August 20.—Considerable damage to corn and tobacco by washing and flooding was reported from Owensboro.

August 22.—A woman was killed by lightning near Weed, Adair County.

August 26.—Heavy hail occurred over most of Carroll County, causing extensive damage to corn and tobacco. At Ghent hail is said to have remained on the ground for four hours after the storm ended. Heavy hail also occurred at Covington, Newport, and Ludlow.

Rivers:—Freshets occurred in small streams at various times during the month. Except for a moderate rise in the middle reaches of the Ohio during the period 13-17th, low stages prevailed in that stream.

Daily Temperatures for August, 1923.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVIII. LOUISVILLE, KY., SEPTEMBER, 1923. No. 9

GENERAL SUMMARY.

Marked extremes in temperature and precipitation characterized the month's weather. A warm week at the beginning was followed by ten days of unseasonably cool weather that culminated in heavy frosts in the northeastern counties, where the foliage of late crops was seriously damaged. Light frosts in other parts of the State caused no injury of consequence, but the continued low temperature delayed growth and ripening of late corn and tobacco. Persistent showers and high humidity during the first half of this period retarded the curing of tobacco, and caused considerable sweating or "houseburn" in the more recent cuttings. The decade of very warm and comparatively dry weather, with which the month closed, contributed much to overcome the effect of the previously unfavorable conditions. Sweating in barns ceased, curing proceeded rapidly, and much better progress was made with cutting. Except for small parts of scattered crops, all tobacco had been cut by the end of the month.

Precipitation was generally excessive in the southern and western counties, over areas that received too much rain in August preceding. As a result corn and tobacco on low or flat lands in that district made poor growth and yields. The rains greatly delayed the cutting and housing of tobacco in the Dark district, and caused corn to remain green and sappy much later than usual. Little progress was possible with corn cutting until the last week. The lighter rainfall in the Burley district interfered only slightly with harvesting the crops. The dry, hot weather of the last decade was timely for making late hay of alfalfa, cowpeas, and soybeans. Considerable rye was sown, mostly on tobacco stubble, for a winter cover crop. Late potatoes suffered from too much rain in the wet districts, and did not receive enough rain in some northern counties. Pastures, young clover, and all grasses grew exceptionally rank, but became quite weedy in wet districts. Shortage of labor on the farm, as well as the wet weather, prevented much fall plowing until late in the month.

TEMPERATURE.

The average temperature for the month, 41 stations reporting, was 69.8°, which is 0.2° below normal. In the period 13-16th, mean daily temperatures ranged from 10° to 18° below normal, and minimum temperatures registered from 30° to 45° at most stations. In the warm period from the 24th to 29th, maximum temperatures near or above 90° occurred in all districts. The extremes for the month were 94° at several stations on the 27th and 28th, and 30° at Farmers on the 16th.

PRECIPITATION.

The average precipitation for the State, based on reports from 57 stations, was 2.87 inches, which is 0.11 inch above normal. Showers occurred generally in the periods, 3d-8th and 18th-21st, and locally in the central and eastern counties on the 12th. Marked irregularity characterized the areal distribution. In the western counties amounts ranged between 3.0 and 5.0 inches at most stations, and they were generally above 3.0 inches in the eastern mountain section. In most of the central district they ranged between 1.5 and 3.0 inches, and in the northern bluegrass from 0.6 to 1.5 inches. At the various stations the monthly precipitation varied between 0.60 at Scott and 5.34 inches at Paducah. Thunderstorms were frequent, especially during the first half of the month.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc.
† Also on other dates. †† Received too late to be included in means and summaries
T Precipitation is less than 0.01 inch rain or melted snow.
¶ Post-office address, Covington, Ky.

MISCELLANEOUS.

Sept. 3.—A tornadic funnel, very long and narrow, white in color and probably composed of dust, accompanied a local thundershower in northern Ballard County. It was observed from the Weather Bureau Office at Cairo, Ill., but was too far away to hear the noise or to determine the direction of movement. No damage was reported.

Sept. 12.—Lightning caused the destruction of a factory at Louisville, with a loss estimated at $27,000.

Rivers.—Low stages prevailed in all rivers of the State during the month.

Daily Precipitation for September, 1923

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVIII. LOUISVILLE, KY., OCTOBER, 1923. No. 10

GENERAL SUMMARY.

Temperatures unfavorable for growth prevailed during the first decade. Heavy to killing frosts in the northeastern counties from the 6th to 8th practically ended the growing season in that district, and caused some damage to late corn and potatoes. Tobacco cutting had been completed before the occurrence of these frosts. In the southern and western counties light frost at that time caused no damage of consequence; but the extended period of low temperature delayed the maturity of late crops. Killing frosts occurred generally over the State in the period 20th-22d. Except to very late market gardens, these frosts caused no damage.

Precipitation in excess of normal, due mostly to one heavy rain on the 17-18th, occurred in the valley of the lower Green and westward to the lower Cumberland; but there was a marked deficiency in the central and eastern districts. Corn cutting, which has been delayed by slow growth and the general lateness of the crop, was completed during the first decade. Early corn became thoroughly dry, and gathering commenced on many farms. Rye, sown for cover and pasture, grew slowly on account of the dry weather. Wheat sowing commenced in the northern counties during the first week, when there was still sufficient soil moisture for germination. Wheat sown after the 10th, mostly in the southern counties, largely failed to germinate until late in the month. The dry weather favored rapid curing of tobacco, most of which was quite dry by the end of the month. The late potato crop was reduced by the dry weather. Pastures, which were fair at the beginning of the month, deteriorated rapidly and became decidedly short, with feeding necessary during the last week. Shortage of stock water was reported from the hilly districts. The weather was exceptionally favorable for picking and marketing fruit, and for saving late hay.

TEMPERATURE.

The average temperature for the month, 40 stations reporting, was 56.5°, which is 1.3° below normal. Freezing temperatures in the northeastern counties, and slightly above freezing in other districts, were registered on the 6th. Unseasonably warm weather, with maximum temperatures ranging from 75° to 85°, prevailed in the period, 10-18th. From the 20th to 26th, freezing temperatures were reported from some part of the State every day. This cool period ended with a severe freeze on the 31st. The extremes for the month were 89° at Beattyville on the 13th, and 19° at Anchorage on the 31st.

PRECIPITATION.

The average precipitation for the State, based on reports from 57 stations, was 1.68 inches, which is 0.82 inch less than normal. There was no rain of consequence during the first half of the month. Heavy rains occurred in the western counties from the 16th to 18th; and light to moderate showers in the central and eastern districts from the 17th to 19th. Rain or snow occurred in the eastern counties in the period 23d-25th, and light showers generally over the State from the 28th to 31st. In the western counties monthly amounts ranged between 2.5 and 5.0 inches, but precipitation decreased rapidly eastward where it was generally less than 1.0 inch in the east-central district, including most of the bluegrass region. The mountain region received from 1.0 to 2.0 inches. For the State amounts varied between 0.29 inch at Frankfort and 4.97 inches at Owensboro. Heavy snow on the 23d in the eastern mountain counties broke large limbs from trees, and caused extensive damage to telephone, telegraph, and power lines.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc.
† Also on other dates. †† Received too late to be included in means and summaries
T Precipitation is less than 0.01 inch rain or melted snow
¶ Post-office address, Covington, Ky.

Rivers:—Low stages prevailed in all rivers of the State during the month. In the Ohio stages were so low at several places that navigation was seriously impeded.

Daily Precipitation for October, 1923

Stations	Day of month.																													Total for month.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

Daily Temperatures for October, 1923.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVIII. LOUISVILLE, KY., NOVEMBER, 1923. No. 11

GENERAL SUMMARY.

Persistent cool weather during the first decade, with several hard freezes, delayed the growth of wheat, rye and grasses; but the warmer weather that predominated after the 10th favored the continuation of slow growth and caused the germination of considerable wheat that was sown late in the preceding month. In the central and eastern counties soil moisture was generally deficient until late in the month. Most wheat, therefore, remained small, and the later sowings made little growth after coming up. Rye for pasture grew more slowly and furnished less forage than desirable. As pastures had practically dried up during the previous month and rye pasture was insufficient, generous feeding of all stock became necessary early in the month. It was only in some western counties, where good rains occurred in October, that pastures improved to any considerable extent. The prevailing dry weather was especially favorable for the care and feeding of stock outdoors.

Rain occurred generally during the first week, but it was not sufficient in the central and eastern districts to revive wells and springs. Stock water was not fully replenished until the rains during the last decade, which filled the small streams. Corn gathering, which proceeded rapidly with little interference from rain, had been completed on many farms by the end of the month. The crop was cribbed in much drier condition than usual. Tobacco could be handled on only a few days. In general the weather was too dry and the showers of too short duration to supply the necessary humidity for softening the leaf. In the extreme southwest cotton picking was nearly completed. Roads continued in good condition throughout the month. The favorable weather also permitted excellent progress with road construction and repair.

TEMPERATURE.

The average temperature for the month, 42 stations reporting, was 46.4°, which is 0.3° above normal. Temperatures ranging from 18° to 28° were registered generally over the State in the periods, 1st, 9-10th, and 27-28th; while temperatures of freezing or lower occurred on several other dates in the central and eastern counties. Moderately high maxima, from the 11th to 25th, ranging from 60° to 70° on several days, caused relatively warm weather which was favorable for slow growth of winter grains. Extremes for the State were 75° at Beaver Dam and Bowling Green on the 11th, and 16° at Farmers on the 1st.

PRECIPITATION.

The average precipitation for the State, based on reports from 56 stations, was 3.65 inches, which is 0.30 inch above normal. Moderate to heavy rains occurred generally over the State in the periods, 3d-7th, 22-23d, 26th, 29-30th. Fair and decidedly favorable weather for outdoor work prevailed from the 8th to 21st, broken only by light local showers in the period, 15-17th. Snow flurries were reported from a few northern stations on the 8th. The distribution of precipitation over the State was fairly regular, but it decreased at a moderate rate from the west toward the east. In the western counties amounts ranged generally between 4.0 and 6.0 inches, and in the central and eastern districts between 2.5 and 3.5 inches. For the State amounts varied between 1.92 inches at Scott and 5.88 inches at Earlington.

MISCELLANEOUS.

The rains of the 6th in the upper Ohio basin caused a slight rise in that stream, but stages declined to low levels that seriously impeded navigation during the next two weeks. Rains in the last week caused slight run-off in the smaller streams and produced a boating stage in the Ohio.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, †, °, appearing in the table indicate number of days missing; for example, b represents two days, etc.
[a] Also on other dates. ++ Received too late to be included in means and summaries
T Precipitation is less than 0.01 inch rain or melted snow
* Postoffice address, Covington, Ky

Daily Precipitation for November, 1923

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

, Precipitation measured in the morning: amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight.

Daily Temperatures for November, 1923.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXVIII. LOUISVILLE, KY., DECEMBER, 1923. No. 12.

GENERAL SUMMARY.

The month was one of the warmest Decembers of record, the average temperature being exceeded only once in this month since State averages were established in 1889. Except on three or four days, daily mean temperatures were above normal, departures frequently ranging from 10° to 25°. Nights free from frost and days of spring-like warmth, occurring in periods of considerable length, favored the growth of grasses and winter grains. A few freezes near the middle of the month had a temporary checking effect, otherwise wheat, rye, and winter oats continued to grow slowly, rooted more deeply, and improved generally in condition as the month progressed. On account of the mild weather, stock fared unusually well outdoors, even obtaining some pasturage from the new growth of grass on south slopes. Muddy fields made difficult the moving of fodder and the gathering of the remnant of corn still out.

Moderate to heavy rains in the first week filled the small streams and fully replenished stock water, which had continued more or less short in the hilly districts until this time. Later in the month frequent and heavy rains, particularly in the western counties, caused floods in headwater streams and overflow of low bottoms. These freshets soon subsided: but continuous showers kept the soil saturated and caused water to remain standing on flat lands. A greater degree of plant growth would have resulted from the unseasonably high temperature, if there had been no super-saturation of the soil. The warmth and dampness were decidedly favorable for handling tobacco. Stripping proceeded rapidly, but hauling to market become difficult late in the month because of the soft condition of the dirt roads. Except on a few days, the weather was too warm for farmers to put up their meat with safety.

TEMPERATURE.

The average temperature for the month, 42 stations reporting, was 46.6°, which is 9.5° above normal, and exceeded only by the average of 50.2° in December 1889. Minimum temperatures ranging from 8° to 20° occurred at most stations on the 14th and 15th, and a few degrees below freezing in the period 16-18th; otherwise minima were remarkably high for a winter month. Maximum temperatures ranging from 50° to 70° were reported from all stations in the periods 1st-13th, 16th-23d, and 27th-31st. Extremes for the State were 75° at Jackson on the 31st and 8° at Anchorage and Junction City on the 14th.

PRECIPITATION.

The average precipitation for the State, as determined from the reports of 59 stations, was 6.60 inches, which is 2.66 inches above normal; and, except in 1902 and 1915, greater than has occurred in any other December of record. Precipitation was moderate to heavy in the periods, 4-6th, 9-13th, 19-24th, and 30th-31st. Except for the first two days and from the 16th to 18th, rain in appreciable amounts was reported from some part of the State on every day. The areal distribution was quite irregular for a winter month. Precipitation was heaviest in a broad belt extending from the southwestern counties to the lower Big Sandy, in which amounts ranged from 6.0 to 9.0 inches. In the vicinity of the Ohio River below Boone County, and in the south-central districts, they ranged between 4.0 and 6.0 inches. For the State, amounts varied between 4.06 inches at Pikeville and 9.73 inches at Junction City. Snowfall ranged from 0.5 inch at some of the western stations to 6.0 inches in the southern counties.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc.
T. Precipitation is less than 0.01 inch rain or melted snow.
[a] Also on other dates. [b] Received too late to be included in means and summaries.
[c] Post-office address, Covington, Ky. [d] Lone Oak.

MISCELLANEOUS.

December 30.—Lightning destroyed barns in Caldwell and Edmonson counties.

Rivers.—Moderate rises followed the rains of the 5th and 6th, and streams remained comparatively full during the month. The rains of the 23d and 24th caused further rises, the Ohio reaching flood stage at Evansville on the 30th and stages slightly below flood heights between Catlettsburg and Cincinnati. Green River was above flood stage at Woodbury on the 25th, and at Rumsey from the 27th to 29th.

Daily Precipitation for December, 1923

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

¶ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

**Precipitation for 24 hours, midnight to midnight. ¶ Lone Oak.

Daily Temperatures for December, 1923.

VOL. XXVIII. LOUISVILLE, KY., ANNUAL, 1923. No. 13.

GENERAL SUMMARY.

The temperature for the year averaged near normal, but monthly means departed considerably from the normal during the first five months. Following an exceptionally warm January, February and March were decidedly cold and inclement; while temperatures continued low through most of April and until late in May. The severe March freezes damaged fruit; and also killed much sprouting clover and tobacco seed, which had to be resown early in April. The cold, wet spring delayed germination of most seeds, retarded growth, and interfered seriously with farm work. Corn planting and tobacco setting occurred about two weeks later than usual. Favorable summer and autumn temperatures largely overcame the spring handicap, permitting timely maturity without frost damage of consequence. Except in 1890, precipitation for the year was the greatest on record. It was decidedly heavy in January and February, causing extensive flooding of lowlands. A slight to moderate excess also occurred in every month from March to June, inclusive; followed by a marked deficiency over most of the State in July. August was very wet in the western and southern counties; but rainfall was deficient in the central and eastern divisions during October and November. December was decidedly wet in all districts. There was marked irregularity in areal distribution during the growing season. The June and August rainfall was four to eight inches heavier, at stations in the western counties than in the blue grass region. Continued rains early in June favored tobacco transplanting, but they delayed cultivation of early crops, which became unusually weedy. The crowding of spring work into early summer, due to persistent wet weather, caused cultivation to be neglected when wheat required harvesting. Hot, dry weather prevailed through the period of wheat and hay harvest. Crops began to suffer for rain in the hilly western districts toward the end of July; but the drought was relieved by the heavy August rains, which also restored pastures to luxuriant condition. Early potatoes were good in most districts, but late potatoes were injured somewhat by dry weather in late September and early October. Because of dry soil, rye sown for pasture grew too slowly to furnish much forage. The last cuttings of cowpeas and alfalfa, although very late, had excellent weather in which to cure. Corn, later than usual in maturing, dried out quickly and was gathered under favorable conditions in October and November. Wheat, sown late in soil becoming progressively drier, germinated slowly and was delayed in starting; but slow growth continued through December, allowing the plants to reach a fair size and become well rooted. Tobacco suffered locally from rust in the western counties, but made an excellent crop in the burley district. Some sweating in barns occurred in early September, after which conditions for curing were ideal. Streams became low early in the summer, because of light rainfall over the upper basins, and continued in that condition until the early December rains.

THE WEATHER BY MONTHS.

JANUARY.—Mild weather prevailed, becoming warmer toward the close. Indications of growth appeared in grass, winter grains, and shrubs during the last week. Precipitation much above normal, and occurring mostly during the last two weeks, caused extensive flooding of bottom lands and considerable soil erosion in the western counties. Snowfall was limited to a few flurries in the northern and eastern districts.

FEBRUARY.—Short periods of unseasonably warm weather, alternating sharply with periods of low temperature, caused considerable damage to winter grains by freezing and thawing. Excessive precipitation early in the month prolonged the flood conditions along the western streams, damaging wheat and grass on bottom lands.

MARCH.—Frequent sharp changes in temperature, destructive windstorms, and two severe freezes late in the month, were the characteristic features. Fruit was seriously damaged by the late cold waves, and there was considerable loss of clover and tobacco seed. Early wheat deteriorated and late sown wheat was badly frozen out. The general wintry conditions, as well as the frequent heavy rains, prevented any progress of consequence with plowing or other spring work. Many tobacco plant beds were sown two weeks late.

APRIL.—Unseasonably cold, frequent frosts and heavy rains delayed farm work during the first two weeks; but favorable weather during the remainder of the month permitted rapid progress with plowing and planting. Many tobacco beds and much clover were reseeded during the first week. The development of vegetation was at least two weeks late. Farm work was so behind that the full acreage of oats and potatoes could not be planted.

MAY.—Persistent low temperature during the first three weeks, with snow squalls and heavy frosts in the period, 8-10th, rendered the month exceedingly backward and unfavorable. Frost caused considerable damage to tender vegetables in the northern counties. Rain in appreciable amount, was reported on nearly

(Continued on next page.)

All temperature data are taken from self-registering thermometers.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents 2 days, etc.
[t] Also on other dates.
[t] Also in July.

every day after the 7th, interfering seriously with corn planting and plowing. Tobacco plants made slow growth and transplanting commenced unusually late.

JUNE.—The temperature averaged near normal, but alternated sharply in periods of cool and warm weather. Persistent rains early in the month caused further delay to corn planting, which could not be completed in the preceding month; but they were favorable for tobacco setting. Cultivation of early corn and cutting the first crop of alfalfa were delayed. The hot, dry weather of the last half was ideal for wheat harvest. Field crops improved decidedly, but suffered from lack of cultivation.

JULY.—Normal temperature was favorable for growth, but rainfall was sufficient only in the eastern counties. Drought conditions appeared in the hilly western districts, where early corn began to "fire" and tobacco was retarded. Timothy hay and second crop alfalfa cured properly, and much baling was done in the fields. The quality of wheat and oats was improved by the dry weather that followed harvest, but the yield of oats was reduced.

AUGUST.—High temperature during the first two weeks was followed by a decade of unseasonably cool weather. Frequent heavy rains relieved the incipient drought in the western counties, but caused considerable "drowning" of corn and tobacco on flat lands. Tobacco rust appeared in that district. In general early crops matured rapidly. Cutting tobacco was delayed in the dark district, but progressed rapidly in the burley area, where the rainfall was relatively light.

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. T. Precipitation is less than 0.01 inch rain or melted snow.

SEPTEMBER.—Cool weather, with light frosts, early in the month delayed the maturity of late crops; while persistent showers and high humidity interfered with curing of tobacco. A decade of warm and comparatively dry weather near the close was decidedly favorable. Rainfall was again excessive in much of the western district, but there were localities in the northern counties where moisture was deficient.

OCTOBER.—The month was generally cool. Heavy to killing frosts occurred at the end of the first week in the northeastern counties, but they were not general over the State until the 22d. Precipitation was deficient in the central and eastern districts. Toward the end of the month the soil became too dry to sprout the wheat. Tobacco cured rapidly, but the late potato crop was reduced. Rye for pasture grew slowly.

NOVEMBER.—Frequent freezes early in the month delayed growth, but warmer weather later favored slow development of the belated wheat and caused the last sown to germinate. Precipitation was light and stock water was deficient until late in the month. Corn was gathered rapidly in exceptionally dry condition. Little progress was made with handling tobacco.

DECEMBER.—The month was wet and exceptionally mild; winter grains continuing to grow slowly until the close. Moderate rains during the first week replenished stock water; while heavy and frequent rains later on caused floods in headwater streams that resulted in considerable overflow of lowlands. The mild, damp weather favored handling tobacco, but the bad condition of dirt roads interfered with deliveries.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

NOTE—Tables and charts giving climatic data for Kentucky in detail during 1921 have been published for each month at the Kentucky section center, Weather Bureau Office, Louisville, Ky., and can be obtained from the official in charge at that office. Indexes to special articles published during past years in Kentucky climatological reports will be found in the Monthly Report for June, 1909.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., JANUARY, 1924. No. 1.

GENERAL SUMMARY.

Frequent sharp cold waves, alternating with brief periods of moderate temperature, characterized the month's weather. Outdoor work, except the necessary feeding and care of stock, remained at a standstill. Severe freezes without snow cover caused considerable injury to winter grains, young clover and timothy. The damage was probably more serious because of continued warm weather in December preceding. The plants were not dormant, but passed quite abruptly from temperatures permitting slow growth into sub-zero conditions. The lifting effect of the freezes was most pronounced on the saturated clay uplands of the central and northern counties. Early sown wheat, being well rooted, withstood the freezes fairly well; but late sown wheat, young clover, and timothy deteriorated steadily during the month. Reports indicated that many fields of wheat and young timothy in the northern counties were so badly frozen out that they will be plowed up.

Precipitation averaged above normal, and was distributed in several periods of moderately heavy to excessive rains. The dry, cold, and windy weather that prevailed between these rains was very unfavorable for handling tobacco; also the freezing, thawing, and heavy rains caused the dirt roads to become practically impassable, which greatly hindered deliveries. The heaviest rainfall occurred early in the month, when streams were already full, resulting in floods that covered low bottoms and damaged grains and grass. Some fodder and corn were washed away. These floods subsided very slowly in the western district. Live stock suffered from the sharp changes in temperature; but there was little loss, largely because of the absence of snow. The month ended with a few days of unseasonably mild temperature and a complete thaw.

TEMPERATURE.

The average temperature for the month, 43 stations reporting, was 31.3°, which is 4.2° below normal, and the coldest since January, 1918. Minimum temperatures ranging from zero to 8° below occurred generally over the State on the 5th and 6th. Temperatures slightly above zero were registered on the 21st, and from 5° to 10° above zero on the 14th, 20th and 22d. The unseasonable cold was broken by temperatures above normal in the short periods, 8-10th, 19th, 23d-24th, and 28th-31st. The maximum for the State was 66° at Middlesboro on the 1st and at Sergent on the 10th; while the minimum was −8° at Lone Oak, near Paducah, on the 5th, and at St. John and Junction City on the 6th.

PRECIPITATION.

The average precipitation for the State, based on the reports from 68 stations, was 5.05 inches, which is 0.67 inch above normal. The areal distribution was fairly regular, but in general there was an increase from about 4.0 inches in the district along the Ohio River to nearly 7.0 inches in the upper basins of the Green and Cumberland. Between 3.0 and 4.0 inches occurred in the extreme western and extreme eastern counties. Rains were moderate to heavy in the periods, 1st-3d, 10-11th, 16th, 24-25th, and 30th. For the State, amounts ranged between 3.36 inches at Sergent and 6.96 inches at Glasgow. Snowfalls ranging from a trace to 3.5 inches were reported on the 13th, and flurries on several other dates.

MISCELLANEOUS.

Rivers.—The Ohio again passed flood stage at Evansville on the 2d. Flood stages were reached at all stations from Catlettsburg to Cloverport on the 4th or 5th; and crests ranging from

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are ‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc. T Precipitation is less than 0.01 inch rain or melted snow §1 one Oak.
* Also on other dates. ** Received too late to be included in means and summaries.
[1] Post-office addresses: – Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8 Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

three feet above flood stage in the upper river to more than eight feet above at Evansville in the period 6-9th. Crests slightly exceeding flood height occurred in the Kentucky and the upper sections of the Licking and Cumberland on the 4th. The Green was above flood stage in the upper course from the 3d to 10th and in the lower from the 4th to 23d.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Daily Temperatures for January, 1924.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., FEBRUARY, 1924. No. 2.

GENERAL SUMMARY.

Long periods of cold weather, attended by severe freezes, alternated with short periods when temperatures averaged much above normal and the surface soil thawed through. These temperature conditions, acting upon a saturated soil, caused further injury to winter grains, timothy, clover and pastures. The plants were lifted out of the ground to an unusual degree, especially on the heavier clay soils of the central uplands. Much clover, young timothy, and late sown wheat died from the effects of the heaving freezes, leaving thin or scattered stands. Early wheat and most rye fared somewhat better, but showed further signs of injury. The condition of the wheat crop was very irregular at the close of the month, ranging from poor to good, depending on the character and drainage of soil and the time of sowing. It was evident that a considerable part of the area sown to late wheat would be plowed up. Bluegrass in pastures and on lawns appeared to be dead, or nearly so, in large patches; a condition somewhat unusual for this plant, which generally resists the worst winters reasonably well. Light snow afforded some protection to grains during the last week, otherwise the ground was bare throughout the month. The low temperature and frozen ground practically prevented outdoor work. Few tobacco plantbeds were sown and no plowing was done. Precipitation averaged far below normal, but the soil, being generally frozen, remained saturated. The dry, cold weather interfered with handling tobacco, while the roads became worse and hindered deliveries. For these reasons a large part of this work, which should have been completed this month, had to be deferred. Improved roads softened badly, and all roads were reported in the worst condition observed in many years.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 36.0°, which is normal for this month. The coldest weather prevailed in the periods 6-9th and 21st-27th, when minimum temperatures ranged between 10° and 20° at most stations. Mean temperatures were characterized by sharp departures, both above and below normal. The highest for the State was 71° at Bowling Green on the 3d and at Richmond on the 4th; and the lowest 9° at Farmers on the 22d.

PRECIPITATION.

The average precipitation for the State, based on reports from 71 stations, was 2.56 inches, which is 0.97 inch below normal. In the south-central and northeastern counties, amounts ranged between 3.0 and 5.0 inches; but they decreased northwestward toward the Ohio River, varying in that district between 1.5 and 2.5 inches. Rain was general and moderately heavy from the 17th to 20th. Light rain, ending in snow occurred from the 4th to 7th; and light snow in the periods, 10-11th, and 23d-24th. Snowfall ranged from 2.0 to 5.0 inches in the central, northeastern, and extreme western counties; but it was much lighter in most other sections. For the State, the total precipitation ranged between 1.46 inches at Louisville and 5.10 inches at Middlesboro. Thunderstorms were reported from a few stations on the 4th.

MISCELLANEOUS.

Rivers.—A sharp rise in the Ohio River followed the rains of the 19th and 20th, but flood stages were not reached at any station. The upper Green was slightly above flood stage on the 22d and 23d.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Also on other dates. ‡ Received too late to be included in means and summaries.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., MARCH, 1924. No. 3.

GENERAL SUMMARY.

Except for a few brief periods of moderate temperature, amounting altogether to about a week, weather conditions throughout the month resembled mid-winter. Thawing during the day and freezing at night caused further deterioration in winter grains, clover, and alfalfa, by pulling the plants out of the ground or separating the crown from the roots. Plants that were not pulled up were lifted considerably and seriously weakened. Late sown wheat appeared to be practically ruined, while the early sown showed marked injury and ranged in condition from poor to fair. On clay lands the damage to alfalfa in many cases was so extensive as to cause the death of more than half of the plants, while clover fared but little better. Timothy meadows were also badly damaged, but not to so great an extent. Precipitation averaged less than normal; but its frequency, together with the predominant cloudiness and low temperature, kept the soil too wet to be worked nearly all of the time. These unfavorable weather conditions almost entirely prevented plowing, and greatly hindered the sowing of tobacco plantbeds. A few warm days near the end of the month permitted the sowing of many beds, and also made possible a beginning with plowing and potato planting; but all work was quickly stopped by heavy rains, followed by severe freezes. Considerable grass seed was sown on wheat during the last week, but much of this work had to be deferred until the following month. The acreage sown was less than usual because of the large proportion of the wheat crop to be plowed up. Roads continued in bad condition. Fruit remained dormant and was believed to be uninjured.

TEMPERATURE.

The average temperature for the State, 42 stations reporting, was 41.5°, which is 4.9° below normal, and the lowest for March since 1915. Minimum temperatures ranged between 5° and 28° at most stations from the 6th to 17th, and reached or fell below the freezing point on most other days. The extremes for the State were 14° at Anchorage on the 16th and 81° at Jackson on the 29th.

PRECIPITATION.

The average precipitation for the State, based on reports from 70 stations, was 3.05 inches, which is 1.79 inches below normal. Precipitation was moderate to heavy on the 5th and 29th, and in the period 20th-22d. It was light and mostly in the form of snow from the 10th to 15th. Snow also occurred in the northern counties on the 21st. The total snowfall was extremely variable, ranging from a trace near the southern border to more than 6.0 inches at a few northern stations. In a belt of the width of four to five counties across the northern part of the State, from the lower Big Sandy to Ballard County, the total precipitation ranged between 2.0 and 3.0 inches. From 3.0 to 5.0 inches occurred in other districts. The range for the State was between 1.82 inches at Henderson and Marion, and 6.24 inches at Greensburg. Thunderstorms were reported on the 4th, 5th, 28th, and 29th.

MISCELLANEOUS.

March 28-29.—In nearly all parts of the State, buildings, fences, and wire systems were extensively damaged by winds that reached velocities of 60 to 70 miles per hour. In Ballard and McCracken counties the damage to buildings, mostly tobacco barns, 40 of which were reported destroyed, was estimated at $300,000. The towns of Lamont, Grahamville and

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

T. Precipitation is less than 0.01 inch rain or melted snow.

†Also on other dates. ††Received too late to be included in means and summaries.

§Lone Oak.

¶Post-office addresses: —Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

Maxom, west of Paducah, suffered severely in buildings destroyed. Three persons were injured in that section. Damage was also extensive in the vicinity of Covington and Newport.

Rivers.—A sharp rise occurred in the Ohio during the last week, otherwise stages were moderate. Flood stages had not been reached when the month closed.

Daily Precipitation for March, 1924

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

|| Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

*Lone Oak.

Daily Temperatures for March, 1924.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., APRIL, 1924. No. 4.

GENERAL SUMMARY.

The month began with unseasonable cold, vegetation in a dormant condition, and farmers badly behind with their work. Many tobacco plantbeds remained to be sown during the first week, which is later than desirable. After the first few days the temperature rose sharply and continued generally favorable. Because of the frequent hard freezes and the light precipitation during the late winter, the soil worked exceptionally well, and progress in its preparation was correspondingly rapid. The light rainfall during the first three weeks scarcely interfered with plowing and planting, which nearly reached seasonal advancement by the end of the month. Early potatoes were planted during the second and third weeks, which is somewhat late. Most tobacco plants were not up until late in the month, germination being delayed in the earliest beds by cool weather. From one-fourth to one-half of the area sown to wheat was plowed up. Losses from winter-killing were greatest on the clay uplands of the north-central counties, where many fields appeared almost entirely bare. Even the wheat allowed to stand presented a spotted appearance, the plants being too much weakened by the winter freezes to stool out and cover the ground. Rye had suffered nearly as much as wheat, hence spring pasturage obtained from it was disappointing. Winter-killing of meadows, especially clover and alfalfa, ranged from one-half to three-fourths of the stand, therefore the larger part of these crops was plowed up for corn or tobacco. The probable shortage in hay influenced the sowing of a large crop of oats. A good stand of young clover was obtained in most districts. Fruit bloom was late but heavy, and there was no apparent injury from the frost of the 23d. Corn planting commenced in the southern counties, and cotton planting in the Purchase, about the 20th. The area devoted to cotton is being expanded northward in the extreme western counties. Pastures improved slowly but were scarcely ready for grazing until the last week.

TEMPERATURE.

The average temperature for the State, 41 stations reporting, was 57.4°, which is 1.5° above normal. Minimum temperatures below freezing occurred generally on the first two days. The 2d was the latest date on which killing frosts occurred in all parts of the State. Freezing temperatures and killing frosts were reported from the north-central and northeastern counties on the 23d. The extremes were 93° at Mayfield on the 15th, and 19° at Greenville on the 2d.

PRECIPITATION.

The average precipitation for the State, based on reports from 70 stations was 3.41 inches, which is 0.62 inches below normal. Precipitation was light and local in the periods, 4-5th, 8-9th, and 22d. Moderate to heavy showers were fairly general on the 17th and 18th, and from the 26th to the 30th. In the west-central counties, the total monthly amounts ranged between 4.0 and 6.0 inches, and from 2.0 to 3.5 inches in most other districts. Considerable snow occurred on the 1st and 2d in the northern half of the State, but most of it melted as it fell. The range in total precipitation for the State was between 1.76 inches at Ravenna, and 6.25 inches at Leitchfield. Thunderstorms were reported on the 6th, 8th, 9th, 14th, 16th, 17th, 21st, 23d, and daily from the 25th to 30th.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference-letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
+ Also on other dates. †† Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.
¶ Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS.

April 26.—A man was shocked into unconsciousness by lightning, while working in a field near Bowling Green.

Rivers.—The Ohio River reached flood stages at Catlettsburg and Portsmouth on the 2d, Evansville on the 3d, and Cloverport

Daily Precipitation for April, 1924

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

on the 4th. Crests were only slightly higher, and the river receded rapidly to moderate stages.

Hail: 26th, near Buckner, moderate, causing some damage to twigs of trees.

Daily Temperatures for April, 1924.

*, †, etc. indicate respectively 1, 2, 3, etc., days missing from record.

UNKE

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., MAY, 1924. No. 5.

GENERAL SUMMARY.

Low temperature, persistent showers, and lack of sunshine characterized the weather, and combined to produce an exceptionally unfavorable month. At its beginning farm work was scarcely abreast of the season but had made excellent progress. By the end however, it was from two to three weeks behind. Preparation of soil was practically suspended, and farmers made every effort to plant the fields already prepared for corn, during the brief intervals when this work was possible. Fortunately most of the corn land had been made ready in the month preceding. On the warm limestone soils of the bluegrass region and in the sandy bottoms, early corn came up to a fair stand; but on the upland clays the stand was poor and required extensive replanting. The cool, wet weather favored cutworm activity, which caused considerable damage to corn and tobacco plants. Wheat improved slowly and was fairly good when it began to head, but showers interfered with fertilization. For this reason, and also because of an uneven stand, it was apparent that the crop of bluegrass seed would be short. Oats and potatoes, more tolerant of cool weather, fared better than other crops. The slow growth of tobacco plants caused setting to commence about two weeks late. It was about one-half completed in the southern counties by the end of the month, but had just begun in the Burley district. Early cotton in the Purchase had to be extensively replanted. Planting was practically prevented in a new area east of the lower Cumberland and near the south border, where it was intended to experiment with this crop. Pastures improved, but not at their normal rate. Old meadows of timothy, clover, and alfalfa became very weedy and in many cases were not worth cutting. The first crop of alfalfa was allowed to stand too long because the weather was unfit for curing. There was an excellent prospect for fruit. Strawberries improved steadily, but rain interfered with picking.

TEMPERATURE.

The average temperature for the State, 41 stations reporting, was 59.9°, which is 5.7° below normal and, with the exception of May, 1917, the lowest since State records were established. On most days minimum temperatures ranged between 40° and 50°, falling as low as 38° at several stations on the 15th, 25th, and 26th. The extremes were 92° at Bowling Green on the 5th and 34° at Farmers on the 26th.

PRECIPITATION.

The average precipitation for the State, based on reports from 70 stations, was 5.04 inches, which is 1.07 inches above normal. Rain was reported from some part of the State every day in the month except the 5th. It was the remarkable frequency, rather than the amount, that interfered so seriously with farm work. Periods with light to moderate rains were: 7-14th, 24-25th; moderate to heavy rains, 20th-21st, 27-29th. Local showers occurred in the intervals between these periods. Rainfall increased from north to south, monthly amounts in the northern counties ranging between 3.0 and 5.0 inches and in the southern from 5.0 to 8.0 inches. Thunderstorms were reported on 20 days. Light hail, causing no damage, occurred as follows: Williamstown, 7th; Lexington, Taylorsville, 10th; Louisville, 3d, 10th, and 24th. Heavy hail in the vicinity of Glasgow on the 19th over a strip of country about four miles long caused damage to wheat, tobacco beds, and orchards estimated at $5,000.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
† Also on other dates. †† Received too late to be included in means and summaries T. Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.
¶ Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS.

Rivers.—Crests near flood stage occurred in the Ohio between Cincinnati and Catlettsburg on the 16th and 17th. Flood stage was nearly reached at Cloverport on the 20th, and stages were above flood height at Evansville from the 20th to 24th. Plowing was delayed by extensive flooding of bottoms in western Kentucky.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., JUNE, 1924. No. 6

GENERAL SUMMARY.

Unseasonably cool weather continued during the first week, after which favorable temperatures prevailed. Farm operations were seriously hindered throughout the month by the persistent rains. Although precipitation averaged only slightly above normal, its extraordinary frequency kept the soil almost continuously too wet for corn planting or cultivation. Early corn became very weedy, but fields planted in the occasional intervals when this work could be done, were generally reworked before planting. Corn planting continued throughout the month, whenever possible, but was not completed on many farms. The warm weather caused rapid improvement in early corn, which soon assumed its normal dark green color. Except on the well drained upland soils of the bluegrass and central hills, cultivation made little progress. Wheat improved slowly until time of ripening. Harvest began near the south border about the 20th and reached the northern counties during the next decade. The showery weather contributed to securing a good stand of tobacco, although considerable replanting was necessary because of cutworm damage. Delay in setting and some decrease in acreage were caused by lateness and scarcity of plants of the proper size. Transplanting continued, as plants became large enough, until the last week. There was little opportunity to cure the first crop of alfalfa, which, in many cases, stood until the end of the month, at which time the second crop ranged from stubble to a stage ready for cutting. A large acreage of cowpeas and soybeans, principally the latter, was planted during the last two weeks, to make up for the lack of other forage. Oats, potatoes, and gardens made excellent progress. There was improvement in the crop of bluegrass seed, but the fair weather came too late to greatly benefit it, except to aid in stripping and curing. The situation on the farm improved slowly, but work remained about two weeks behind.

TEMPERATURE.

The average temperature for the State, 41 stations reporting, was 74.2°, which is 6.3 above normal. Minimum temperatures between 40° and 55° occurred at most stations during the first week, after which daily means were near or above normal. Extremes at the various stations were 99° at Bowling Green and Beattyville on the 20th, and 42° at Anchorage on the 1st.

PRECIPITATION.

The average precipitation for the State, 70 stations reporting, was 4.39 inches, which is 0.30 inch above normal. Rain in amount sufficient to measure was reported from some locality in the State every day. Showers occurred more or less generally as follows: central and east, 4-6th; east, 9-11th; in all districts, 21st-24th, 27th, and 28th. Daily amounts were extremely variable and local, generally attending thunderstorms, which were reported on 23 days. There was also marked irregularity in areal distribution. Monthly amounts ranged between 5.0 and 8.0 inches in the eastern mountain region, from the lower Kentucky River basin to Jefferson County, and in other restricted areas. In most western and central counties, and in the northern bluegrass, they ranged between 2.0 and 4.0 inches. The extremes for the State were 1.92 inches at Burnside and 8.37 inches at Ravenna. Heavy hail occurred at Blandville on the 12th and light hail at Hickman on the 13th.

All temperature data are taken from self-registering thermometers. The records are computed only for such stations as have ten or more years of record, but all complete reports are published. The departures from normal temperature and precipitation are computed only for such stations as have records sufficient to afford reliable data for use in determining section or division means. † Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, "a," appearing in the table indicate number of days missing; for example, b represents two days, etc. ‡ Lone Oak.

* Also on other dates. † Precipitation is less than 0.01 inch rain or melted snow. ‡ Received too late to be included in means and summaries.

[a] Post office addresses — Lock 7, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS.

Lightning casualties: June 3 – Young woman killed under a tree near Glasgow; a man severely injured, in a barn near Harrodsburg; June 8, a boy killed under a tree, near Somerset; June 9, a young man killed in a barn, near Hesler; June 23, a physician killed in the open in his yard, near Grassy Lick. Damages by excessive rains: June 10, by washout at Idamay, Ky., estimated at $200,000; June 12, by windstorm in Ballard

Daily Precipitation for June, 1924

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., JULY, 1924. No. 7

GENERAL SUMMARY.

Prevailing low temperature was unfavorable for the growth of the belated corn crop, but light precipitation, except in the extreme western counties, and abundant sunshine compensated measurably for the lack of the usual summer heat. Frequent showers in the region west of the lower Tennessee, known as the Purchase, interfered with the cultivation of corn, tobacco, and cotton, and delayed hay and oats harvest; otherwise weather conditions were decidedly favorable for farm work and the excellent progress made brought operations practically abreast of crop advancement. Some early corn remained weedy when laid by, but in general farmers were able to give crops sufficient and timely cultivation. Marked irregularity in growth of much early corn, indicated by numerous small areas of diminutive plants in fields of large corn, was believed to be due to the effect of the long continued wet weather on some heavy soils. Early corn tasseled late in the month, at about the time ears are well formed in normal seasons. Some corn was planted as late as the 10th, generally from northern seed. Early tobacco grew rapidly, but late started slowly and unevenly because of the drying of the surface soil. Urgency of other work delayed cultivation of tobacco during the first two weeks, but continued favorable weather permitted satisfactory progress later on. Topping of the earliest settings began near the end of the month, about two weeks later than usual. Rust appeared to an alarming extent, even on small plants, but the dry, warm weather late in the month checked its progress. Weather conditions of the spring and early summer were similar to those ordinarily prevailing about 200 miles farther north, hence they were favorable for oats and resulted in the best crop that has been grown in this State in many years. Scarcity of machines and waiting for the heavy oats crop caused threshing to make rather slow progress. Moisture was sufficient for planting late potatoes during the first half of the month, but the soil became somewhat dry later on. Soybeans and cowpeas made splendid growth. All crops were needing rain at the end of the month.

TEMPERATURE.

The average temperature for the State, 41 stations reporting, was 73.7°, which is 3.2° below normal; and, with the exception of July 1890, the lowest on record. Low night temperatures, ranging on many days between 50° and 60°; and moderate maximum temperatures, seldom rising to 90°, characterized the weather. The mean temperatures of the first four days ranged from 10° to 14° below normal. Temperatures slightly above normal occurred on only seven days. Extremes were 99° at Bowling Green on the 22d and 45° at Berea on the 1st.

PRECIPITATION.

The average precipitation for the State, 71 stations reporting, was 3.63 inches, which is 0.54 inch below normal. Moderate to heavy rains occurred generally in the period 12-14th, and again in the western counties from the 16th to 20th, otherwise the rain accompanied local thundershowers and was distributed with marked irregularity. Monthly amounts in the southern counties, the mountain region, and a limited area in the western bluegrass, ranged between 4.0 and 6.0 inches. In the remainder of the bluegrass, and in the northwestern counties near the river, they ranged between 1.0 and 3.0 inches. At the end of the month indications of drought were apparent in the districts with lightest precipitation. Extremes for the State were 0.89

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, "a," "b," appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.
[a] Also on other dates. [b] Received too late to be included in means and summaries. [e] Precipitation is less than 0.01 inch rain or melted snow. T. Precipitation is less than 0.01 inch rain or melted snow.
[f] Received too late to be included in means and summaries. [g] Reed House, Ky.; Scott, Covington, Ky.
Postoffice addresses: Lock 3, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.;

inch at Leitchfield and 6.38 inches at Taylorsville. No dam- aging hail was reported.

pool stages along most of its course by the 20th. Tributary streams in the State also declined to low stages.

MISCELLANEOUS.

River.—A steady decline in the Ohio lowered the water to

VOL. XXIX LOUISVILLE, KY., AUGUST, 1924. No. 8

GENERAL SUMMARY.

Except for a short period of unseasonably cool weather, about a week in length, near the middle of the month; temperatures averaged near or above normal on most days. The warm weather and abundant sunshine favored the growth of corn in those districts where soil moisture was sufficient. Precipitation was variable, badly distributed, and more or less deficient in most localities. In the bluegrass region, the south-central counties, and the Green River Valley, periods of three weeks or more elapsed between good rains. On the stronger soils of the northeastern and southwestern counties corn and tobacco made good growth; but on the thinner soils elsewhere in the dry districts these crops "fired" and suffered marked injury from drought. A serious result of the dry weather was its retarding influence on the growth of late corn and tobacco, much of which could not be expected to mature except under the most favorable weather conditions. Early tobacco failed to spread properly, and there was also a disposition to premature ripening and drying of the bottom leaves. Cutting commenced in a limited way late in the month, brought about somewhat prematurely in many cases because of "firing." Not all late tobacco was topped, farmers prefering to take the risk of frost damage in order to obtain a larger yield; as undersized tobacco, too small to be topped for good leaf, represented an exceptionally large part of the crop. In the east-central and extreme western counties enough rain occurred to keep the staple crops growing. Rust on tobacco remained localized, due to the dry weather, and caused little injury. Alfalfa and other forage crops grew well until affected by the drought near the end of the month. Late potatoes came up well, but moisture was not sufficient to keep them growing properly. Pastures deteriorated in most districts. The weather was favorable for cotton, which is being grown experimentally in a much larger area in the southwestern counties.

TEMPERATURE.

The average temperature for the State, 40 stations reporting, was 76.5°, which is 0.9° above normal. Moderately high maxima, frequently above 90°, occurred almost daily during the first and last decades. There were many warm nights, favorable for corn, in this period. Cool weather, with comparatively low night temperatures, prevailed on several days near the middle and at the end of the month. Extremes for the State were 108° on the 21st, at Franklin, and 43° on the 15th, at Farmers.

PRECIPITATION.

The average precipitation for the State, based on the records of 70 stations, was 3.00 inches, which is 0.71 inch less than normal. It occurred in the form of frequent local thundershowers, often so light as to be of little consequence. There was no period of general rains. The precipitation on the 7th, when most stations in the central and western counties received moderate to heavy showers, came nearest to reaching all districts. Showers also occurred locally in the periods, 1st-3d, 12th, 16-17th, and 20-25th. The areal distribution was extremely irregular. In a broad belt extending from east to west across the central counties, monthly amounts ranged from 3.0 to 7.0 inches; and in most of the Purchase from 3.0 to 6.0 inches. In the northern bluegrass and most of the southern counties they varied between 1.0 and 3.0 inches, while in most of the Green River Valley less than 1.0 was received. For the State amounts ranged between 0.32 inch at Bowling Green (No. 2) and 7.17 inches at St. John.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
[a] Also on other dates. †Received too late to be included in means and summaries. †Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

August 24:—A boy was killed by lightning near Bagdad, while in a barn. Lightning destroyed three valuable horses and two barns in Bourbon County.

Hail damaged crops in Hardin, Larue, and Simpson counties on the 2d; near Greensburg on the 11th; and near Lexington on the 31st.

Rivers.—Stages were low in all streams during the month.

Daily Temperatures for August, 1924.

VOL. XXIX LOUISVILLE, KY., SEPTEMBER, 1924. No. 9

GENERAL SUMMARY.

The month was one of the coolest of the name on record in this State. Light frost was reported from the central counties on the 6th, and from the central and eastern districts on the 10th. These frosts slightly affected tender vegetation, including tobacco, but caused no damage of consequence. The most serious effect of the prevailing low temperature was to retard the growth and delay the ripening of the late crops; which, because of the extreme backwardness of the season, needed exceptionally favorable conditions to mature before expectation of killing frost. Dry weather, during the first half of the month, approaching severe drought conditions in the Green River Valley and south-central districts, also delayed growth of late corn and tobacco and damaged the late potato crop. Heavy rains about the middle of the month in most of the State, but generally light to moderate in the drought stricken areas, greatly benefited late crops and pastures. Growth continued slow, however, because of the unseasonably cool weather that followed the rains and persisted until the end of the month. Conditions were generally favorable for cutting and curing early tobacco, although the dry weather caused considerable "firing" in the drier districts and reduction in yield. Late tobacco improved after the rains, and cutting had commenced by the close of the month. Early corn matured in good condition in the northern counties, but "fired" badly in large areas in southern districts. It became safe from frost about the third week, but continued so sappy that cutting had to proceed slowly. Late corn grew so slowly that much of it remained in the silk or roasting ear stage when the month ended. Late potatoes made little progress until the rains, but they remained green on account of the cool weather. During the last two weeks they grew fairly well, but they were so late in starting that it was doubtful if the crop could mature before frost. Comparatively light rainfall in the cotton districts favored maturing and opening of bolls. Some excellent results with this crop were reported from a new district in Simpson and adjoining counties.

TEMPERATURE.

The average temperature for the State, 41 stations reporting, was 65 3°, which is 5.0° below normal. Temperatures averaging below normal prevailed throughout the period 2d-18th and on most days during the last decade, with daily deficiencies ranging frequently from 10° to 20°. The extremes for the State were 97° at Earlington on the 1st, and 35° at Farmers on the 6th and at Anchorage on the 10th.

PRECIPITATION.

The average for the State, based on the records of 70 stations, was 4.49 inches, which is 1.68 inches above normal. Precipitation was light and mainly local in the western counties, where amounts ranged from 1 5 to 3.0 inches. It increased toward the east, but was characterized by marked irregularity in the central districts, which received from 3.0 to 5.0 inches, and also in the eastern counties, where from 5.0 to 9.0 inches occurred. Amounts recorded at the various stations ranged between 1.44 inches at Paducah, and 8.94 inches at Middlesboro. Showers occurred locally in the periods 1st-2d, and 8-9th, but rains were moderate to heavy in the central and eastern counties from the 7th to 22d and 28th to 30th. Thunderstorms were reported on 17 days, but were not generally destructive.

MISCELLANEOUS.

Sept 26.—A man was killed by lightning near Tyrone, while standing in the door of a building.

Rivers.—Stages continued relatively low during the month.

All temperatures and precipitation are based on records for the years indicated. Records for some stations have been kept for more than one period, but only for such periods as have been complete and continuous. Stations with records for one or more years of record, but all complete records are for shorter periods.

[a] Observations at this station are taken at 7 a. m., 2 p. m. and 9 p. m. only; mean temperature is computed from these observations. Greenville and Wood may use Locks on the Green River; other Locks are on the Kentucky River.

* Precipitation on dates indicated, but amount not known. Hopkinsville, Greenville and Wood may use Locks on the Green River; other Locks are on the Kentucky River.

† Precipitation on dates indicated is included in next succeeding record. For example, it represents two days, etc.

‡ Data received too late to be included in summaries and averages.

§ Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

Locks: Nos. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 on Kentucky River; Locks 1, 2, 3, 4, 5, 6, 7 on Green River; Locks 1, 2, 3, 4 on Barren River; Locks 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 on Cumberland River; Locks 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 on Ohio River.

Dams: Nos. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40,

CLIMATOLOGICAL DATA.

DEC 3 1924

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., OCTOBER, 1924. No. 10

GENERAL SUMMARY.

Except for a few cool days at the beginning and from the 21st to 24th, unseasonably warm weather prevailed continuously. The month was almost rainless and terminated with severe drought existing over most of the State. The shortage of water for stock and domestic purposes became serious in the southern and western counties, where precipitation had also been deficient in August and September preceding. Killing frost did not occur generally over the State until the 23d; but heavy to killing frost on the 1st in the south-central and southeastern counties practically ruined late corn and tobacco. Probably half of the late portion of these crops was still out at this time, the corn being in the silk or roasting ear. This frost was light and not seriously damaging in other districts. After the 1st, weather conditions were ideal for maturing late crops that had not been badly frosted. The late potato districts, located mainly in the northern counties, escaped the frost; but the crop was somewhat stunted by the cold and later on suffered from lack of moisture. The vines died prematurely shortly after the middle of the month, without yielding a full crop. Much corn, cut and shocked very sappy, and considerabe tobacco, prematurely cut and housed, would have spoiled during normal weather; but the extreme dryness cured out these hastily harvested crops and prevented extensive loss. The later cuttings of tobacco contained a large percentage of frost-stained leaves, which lowered its quality to a marked degree. Much frostbitten or immature corn was used quickly in filling silos or for immediate feeding. Grass pastures were practically dead by the last week, making such feeding necessary. A large amount of corn, although safely dry, was too chaffy to be marketable. Wheat sowing commenced during the first week, with a fair amount of moisture in the soil, but when the work was finished in the third week the soil was so dry that most of the grain failed to germinate. The dry weather favored the maturing of cotton. In general the experimental plantings of this crop in Christian, Simpson, and other southwestern counties, amounting to several thousand acres, made satisfactory yields.

TEMPERATURE.

The average temperature, based on reports from 41 stations, was 61.1°, which is 3.0° above normal. Except for two short periods of unseasonably cool weather, 1st-2d and 21st-24th, when minima fell below freezing at several stations, temperatures continuously above normal prevailed, with summer-like maxima on most days. The highest for the State was 91° at Beaver Dam on the 5th and Hopkinsville on the 8th and 10th, while the lowest was 24° at Beaver Dam and Greenville on the 23d.

PRECIPITATION.

The average precipitation, 71 stations reporting, was 0.27 inch, which is 2.33 inches below normal. This is the lowest average precipitation for October since State records were established in 1889. With the exception of September, 1897, when the average amount was 0.21 inch, it was the lowest for any month of record. Scattered showers occurred on the 4th, 6th, and 31st in the central and western counties, and on the 27th in the eastern districts. At a few stations, mainly in the western part of the State, good rains occurred on the 6th; but in general showers were too light to be of consequence. Four stations, Bowling Green (No. 2), Eubank, Little Hickman, and Oliver reported no rain during the month, while four stations in the basin of the lower Green or vicinity received 1.0 inch or more, the greatest amount for the State being 1.39 inches at Calhoun. In most of the State, amounts ranged between 0.1 and 0.5 inch.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ‡Hunnewell, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.
* Also on other dates. †Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS.

Rivers:—Rivers of the State, including the Ohio, were at very low stages during the mouth

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at that time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Daily Temperatures for October, 1924.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., NOVEMBER, 1924. No. 11

GENERAL SUMMARY.

Drought accompanied by unseasonably high temperature persisted through the first two weeks. The water shortage, which daily became more acute, caused farmers much additional labor in hauling meager supplies long distances. Livestock suffered and milk supplies were affected. It was necessary to restrict the use of water in some cities of the State, and in one instance at least the schools were closed. Brush fires, often fanned by brisk winds, burned over large areas in the central and eastern counties, causing extensive damage to fruit trees, timber, and outbuildings. Good showers on the 15th furnished some water in cisterns and pools; but in most sections there was not sufficient rain to start small streams, hence water for stock again became scarce later in the month. The rains caused late sown wheat to come up to a good stand, but the subnormal temperature of the last two weeks prevented much growth. Early wheat, and rye sown for pasture, which had reached a fair size by the 1st of the month, made no growth of consequence because of the drought and low temperatures that followed. Rather severe cold near the end of the month reduced winter grains to a dormant condition. For these reasons rye furnished less than the usual amount of fall pasture. Grass had dried up in October preceding, therefore feeding was necessary during the entire month. The soft and chaffy corn was profitably utilized for this purpose. Dry soil in stalk fields permitted pasturing of this form of forage to marked advantage. The exceptionally dry condition of corn led to early and rapid gathering. Much late corn was loose on the cob and not marketable, but the thorough drying prevented practically all loss from molding and enhanced its feeding and keeping qualities. The favorable weather also resulted in splendid progress in picking and ginning the cotton crop. Except on two or three days tobacco was too dry to be handled.

TEMPERATURE.

The average temperature for the month, based on reports from 42 stations, was 47.7°, which is 1.4° above normal. The periods 1st-7th and 10-14th were especially warm, maximum temperatures ranging from 70° to 80° on most days. Quite cool weather, with minima generally below freezing and frequently as low as 20°, prevailed from the 16th to the 19th and from the 23d to the end of the month. Extremes for the State were 83° on the 2d and 4th at several central and western stations, and 13° on the 28th at Anchorage.

PRECIPITATION.

The average precipitation, 71 stations reporting, was 1.82 inches, which is 1.71 inches less than normal. Showers occurred locally in the periods, 1st, 7-9th, 21st-24th, and snow on the 28th and 29th. These rains were very light in the western division, but they furnished considerable moisture in other sections. Moderate to heavy showers that reached all districts, and included most of the month's precipitation, occurred from the 12th to 15th. In the southern counties, the total precipitation amounted to 3.0 inches or more. It decreased to about 1.0 inch near the Ohio River, and ranged between 1.5 and 2.0 inches in the central and eastern counties. The smallest monthly amount reported was 0.72 inch at Carrollton, and the greatest 3.86 inches at Burnside. Most of the snow melted as it fell, but in limited areas in the north-central counties measurements ranged from 0.5 to 2.5 inches.

MISCELLANEOUS.

Rivers continued low and navigation was impeded throughout the month.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Postpogue letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

T. Precipitation is less than 0.01 inch rain or melted snow.

§Lone Oak.

† Also on other dates. †† Received too late to be included in means and summaries.

[a] Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

[e] Post office addresses — Lock 5 Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Locks 8 Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

‖ Reference mark *** Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green. (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Daily Temperatures for November, 1924.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., DECEMBER, 1924. No. 12

GENERAL SUMMARY.

Marked extremes in temperature, excessive rains, and damaging windstorms characterized the month's weather. Except for a few days with temperatures below normal, unseasonably warm and springlike weather prevailed from the 1st to the 18th. A severe cold wave reached the western counties on the 19th, and spread over the remainder of the State on the 20th; after which decidedly low temperature persisted until the end of the month. Wheat passed from a condition of slow growth into near-zero temperatures in a period of 48 hours, resulting in considerable injury to the tender tops of plants. There was no snow cover until the 23d-24th, when snow fell generally over the State, and furnished some protection in the northern counties until near the end of the month. The soil remained hard frozen, hence grains were not lifted to any great extent. Farmers continued to gather corn and cotton, and stripped considerable tobacco, during the mild weather; but the advent of the severe conditions practically put an end to all such activities. Icy and rough frozen roads and the dry, cold atmosphere greatly hindered the handling and delivery of tobacco during the cold period.

For the first time in three months precipitation exceeded the monthly average. Most of it occurred, however, in the excessive rains of the 7-8th, which caused floods in the Green and Kentucky rivers, and stages near flood heights in the other streams of the State. These rains fell on a terrain exceptionally dry for early winter, and furnished the first ample supply of stock water since the fall drought had set in. The beds of most small and moderately large streams contained little or no running water when the rains occurred. Considerable corn in shock, caught in the lower bottoms by the sudden rises, was carried away before it was possible to move it. Rye and other pasture improved and furnished some grazing during the mild weather.

TEMPERATURE.

The average temperature for the month, based on reports from 42 stations, was 35.9°, which is 1.7° below normal. In the periods 4-8th, 12-13th, and 15-18th, temperatures ranged from 8° to 30° above normal; while in the period 20-29th they were as far below the seasonal average, and minima on most days ranged from 5° below to 10° above zero. Extremes for the State were 79° at Williamsburg on the 18th and −9° at Owensboro on the 28th.

PRECIPITATION.

The average precipitation, 71 stations reporting, was 5.97 inches, which is 1.89 inches above normal. Heavy to excessive rains prevailed on the 7th and 8th in all districts. Moderate rains occurred generally in the period 4-5th, and light showers locally from the 14th to 19th. Precipitation was also moderate to heavy on the 23d and 24th; mainly in the form of rain in the southern counties, but mostly as snow, ranging from 1.0 to 4.0 inches, in the northern district. An area of heavy precipitation, in which monthly totals ranged from 7.0 to 11.0 inches, included the upper basin of Green River and most of the section to the southward. Amounts diminished toward the north and east, where they ranged between 3.5 and 6.0 inches. Extremes for the State were 3.26 inches at Oneonta, and 11.12 inches at Brownsville. Thunderstorms were reported generally on the 7th and 8th.

MISCELLANEOUS.

Dec. 7.—Windstorms in Trigg, Christian, and Todd counties caused extensive damage to farm buildings, probably amounting to $25,000. A barn was burned by lightning at Clinton.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Record too late to be included in means and summaries. T Precipitation is less than 0.01 inch.
† Last office addresses. Lock 7, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.
‡ Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
§ Lone Oak.

Rivers:—The floods in tributary streams caused a moderate rise in the Ohio about the middle of the month, followed by a quick decline and rapid ice formation during the cold weather. Navigation above Louisville was practically suspended by the 29th.

Daily Precipitation for December, 1924

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Daily Temperatures for December, 1924.

JAMES L. KENDALL, Meteorologist.

VOL. XXIX LOUISVILLE, KY., ANNUAL, 1924. No. 13

GENERAL SUMMARY.

The temperature for the year averaged somewhat below normal, but there was marked variation in the monthly means. Decidedly cold weather predominated from January to March, inclusive, interspersed at rather frequent intervals with short periods of unseasonable warmth. The soil was saturated by heavy rains early in January and remained so until spring, hence the frequent heaving freezes caused extensive damage to winter wheat on clay uplands, and seriously injured clover, timothy, alfalfa, and bluegrass. Winter weather in March prevented growth, but kept fruit in a dormant condition. Warm and comparatively dry weather in April favored progress in spring work; but cold, rainy conditions in May and persistent rains in June interfered greatly with getting out the crops and with early cultivation. Slow growth of plants delayed tobacco setting and reduced the available supply, lessening the acreage and contributing to the late maturity of a large proportion of the crop. Corn could be planted only on occasional days, and was not all in until July. As a result much of it was ruined by frost. The total precipitation was much less than normal, due mainly to extended periods of deficiency from February to April and in the last half of the year. The cool, dry weather in July did not properly advance the late planted crops; but was favorable for harvest and threshing. Areas affected by drought appeared during the month in the northern half of the State. August, although dry, was more favorable as to temperature. Drought became well established in the Green River Valley and the northern bluegrass. The heavy rains in September occurred mainly over the mountain section, leaving most of the agricultural district relatively dry. Unseasonably low temperature in this month delayed the maturity of late crops, and was therefore partly responsible for the heavy losses from frost later on. October was warm and almost rainless. Drought became much worse in all districts, causing serious inconvenience. Late crops in the southern half of the State were badly damaged by frost on the 1st. Most of the late potato areas, which are located in the northern counties, escaped with slight injury. Early wheat and rye sown for pasture grew fairly well; but late wheat failed to germinate until the rains relieved the drought conditions near the middle of November. Pastures dried up early in the fall, making general feeding necessary. Farmers utilized much partly ripe and frosted corn for this purpose, as well as in filling silos. The water supply remained inadequate until the heavy rains early in December. When these fell there was little or no running water in any except the larger streams. Sharp changes in temperature in December from unseasonable warmth to cold of mid-winter severity caused some damage to wheat. Except for two weeks in the first half of December, conditions during the late fall and early winter were not favorable for handling tobacco.

THE WEATHER BY MONTHS.

JANUARY.—Sharp cold waves alternated with brief periods of moderate temperature, resulting in considerable damage to grains from freezing and thawing. Heavy to excessive rains early in the month caused floods that covered low bottoms and washed away some corn and fodder. The dry, cold, windy weather that prevailed between rains was very unfavorable for handling tobacco.

FEBRUARY.—Long periods of cold weather with severe freezes alternated with short periods of relatively high temperature that caused complete thaws. Winter grains, clover, timothy and even bluegrass were lifted out of the ground to an unusual degree. Precipitation was light, but the soil remained saturated because of frequent freezes.

MARCH.—Mid-winter conditions prevailed during most of the month, with frequent freezes and thaws that caused further injury to wheat, clover and alfalfa. Although less than normal in amount, the frequency of precipitation prevented much outdoor work. During a few warm days near the end of the month many tobacco beds were sown and plowing was commenced.

APRIL.—Low temperature at the beginning delayed germination of tobacco seed. Many beds were sown during the first week. Precipitation was comparatively light, the soil worked well, and progress in preparation for planting was rapid. Extensive winter-killing of wheat, timothy, clover, and alfalfa became apparent as growth started. A good stand of young clover was obtained.

MAY.—Cold weather, cloudiness, and frequent showers combined to produce a very unfavorable month. Little progress could be made in preparing soil and planting corn. By taking advantage of every favorable day, farmers succeeded in planting about half of the corn crop. Setting tobacco commenced about two weeks late because of slow growth of plants. Poor germination caused extensive replanting of corn and cotton.

JUNE.—Temperatures were seasonable after the first week, but persistent rains hindered farm operations. Corn planting

All temperature data are taken from self-registering thermometers.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents 2 days, etc.
†Also on other dates.

continued during the month, whenever possible, but was not completed. Lateness and scarcity of tobacco plants caused some decrease in acreage. Fair weather late in the month was favorable for wheat harvest.

JULY.—Prevailing cool weather was unfavorable for corn, which was already much belated, but resulted in a fine crop of oats. Some corn was planted during the first week. Although much delayed, cultivation of corn and tobacco was generally sufficient. Except in the Purchase, light precipitation favored this work. Late tobacco started badly. Both corn and tobacco crops grew unevenly, and averaged exceptionally late.

AUGUST.—Precipitation was badly distributed and more or less deficient. Where soil moisture was sufficient the favorable temperature caused corn and tobacco to develop rapidly, but dry weather retarded growth in large areas. Tobacco and corn "fired" in the dry region toward the end of the month, and all crops showed the effects of the drought.

SEPTEMBER.—Dry cool weather, during the first half, with light frosts, retarded the growth of late crops. Rains were badly distributed and generally light until the middle of the month, after which there was sufficient moisture in most localities. Much late corn was in roasting ear when the month ended. Late potatoes made little growth until the last two weeks.

OCTOBER.—With the exception of a few days, the month was unusually warm. No rain of consequence occurred. Drought, attended by shortage of water for stock and domestic purposes, became serious in most of the State. Heavy frost on the 1st practically ruined late corn and tobacco in the south-central and southeastern districts. The extreme dryness caused the sappy tobacco and corn to cure out remarkably well. Early wheat came up but late sown grain generally failed to germinate.

NOVEMBER.—Drought continued through the first two weeks. The water shortage became acute in many localities, and brush fires caused considerable damage. Rains

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determing in
ction or division means. T. Precipitation is less than 0.01 inch rain or melted snow.

†Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

ar the middle of the month brought up the late wheat, but low temperature prevented
ich growth. Conditions were favorable for corn gathering.

DECEMBER.—Temperature changes were sharp and frequent. The cold wave of the
8-21st, which followed unseasonably warm weather, injured wheat to some extent.

Excessive rains at the end of the first week caused floods in most streams, but furnished
an abundance of water for the first time since the drought. There was light snow
cover in the northern counties from the 24th to the end of the month.

Monthly and Annual Mean Temperatures for the Year 1924, with Departures from the Normal.

All temperature data are taken from self registering thermometers.
The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

Compared with 35 years' normal.

NOTE—Tables and charts giving climatic data for Kentucky in detail during 1924 have been published for each month at the Kentucky section center, Weather Bureau Office, Louisville, Ky., and can be obtained from the Official in Charge at that office. Indexes to special articles published during past years in Kentucky climatological reports will be found in the Monthly Report for June, 1923.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., JANUARY, 1925. No. 1

GENERAL SUMMARY.

Variable temperatures, with the longer periods averaging above normal, prevailed until the 26th. A cold wave of marked severity, that spread over the State on the 27th, brought temperatures of zero or lower to most districts. It was ushered in by a fall of snow, ranging from about 2.0 inches in the southern counties to 10.0 inches in the extreme northern districts, which afforded considerable protection to wheat during the period of lowest temperature. The rather sharp temperature changes during the month, with the accompanying freezes and thaws, had less than the usual effect in lifting wheat, because of the comparatively dry and well-drained condition of the soil. Although the tops of the plants appeared much discolored, having been killed back by the severe freezes late in the December preceding, the roots remained well settled in the soil. Late wheat, which generally showed but one blade, was scarcely visible after the first hard freezes. Most farmers reported its condition as poor, but in the absence of excessive heaving it was believed to be in better condition than its appearance would indicate.

Light precipitation, but little more than half the normal amount in many localities, favored winter grains and outdoor feeding, and delayed the usual mid-winter deterioration of dirt roads. It was sufficient in quantity and frequent enough, however, to soften tobacco for handling. Except during the cold wave, progress in stripping and marketing this crop was excellent. The cold period caused suffering to stock that was noted principally in shrinkage of dairy products. There was also some loss of young lambs; but most of the month was favorable for feeding and the general care of animals. Dirt roads held up fairly well until the thaw that followed the cold wave, after which they became so bad as to delay deliveries of tobacco.

TEMPERATURE.

The average temperature for the month, based on reports from 42 stations, was 35.8°, which is 0.3° above normal. Moderate temperatures, mainly from 2° to 10° above normal, prevailed during the periods, 3d-11th, 14-18th, and 20-26th. During the cold spell, 27-30th, the daily averages ranged from 5° to 25° below normal. On the 28th minimum temperatures near or slightly below zero occurred in all districts except the extreme southwestern counties. Extremes for the State were 66° on the 7th at Greenville, and −9° on the 28th at Williamstown.

PRECIPITATION.

The average precipitation, 70 stations reporting, was 2.60 inches, which is 1.78 inches less than normal for this month. Light to moderate showers occurred in the periods 1st-3d, 11-13th, 15-20th, and moderate to heavy precipitation, mostly snow, on the 26th and 27th. In the southeastern counties and the central bluegrass, amounts for the month ranged between 4.0 and 4.0 inches. They decreased toward the west and northwest, ranging from 2.5 inches in the central counties to 1.5 inches near the Ohio River. Extremes for the State were 4.34 inches at Burnside and 1.11 inches at Owensboro. Sleet occurred quite generally over the northern counties on the 27th, and locally on the 1st, 8th, 9th, 12th, 20th and 26th.

MISCELLANEOUS.

Rivers:—Except for a good rise in the Ohio and other streams from the 19th to 23d, which subsided in a few days, low stages prevailed. Light to moderately heavy floating ice in the upper and middle sections of the Ohio during the first three and the last two days of the month, interfered to some extent with navigation.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.

† Precipitation is less than 0.01 inch rain or melted snow

‡ Also on other dates. †† Received too late to be included in means and summaries

¶Post-office addresses: – Lock 5, Lawrenceburg, Ky. ; Lock 6, Versailles, Ky. ; Lock 8, Nicholasville, Ky. ; Lock 10, Red House, Ky. ; Scott, Covington, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Daily Temperatures for January, 1925.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., FEBRUARY, 1925. No. 2

GENERAL SUMMARY.

Moderate temperature, interspersed with spring-like periods of several days duration, prevailed until near the end of the month. Light precipitation and somewhat more than the average amount of sunshine also contributed to the awakening of vegetation. Some early shrubs began to put out leaves toward the end of the warm period, and indications of swelling buds caused alarm among fruit growers. The severe cold, with which the month closed, checked these untimely tendencies to blossom, before they advanced far enough to expose the buds to general injury. It was believed that plums, which showed the greatest advancement, were somewhat damaged. The unseasonable weather resulted in considerable growth and marked improvement in grass and winter grains. In the last sown wheat the beginning of growth indicated that the plants, although small, were still rooted with some firmness and gave fair promise of a crop where the stand was good. Saturation of the soil from the occasional rains was only temporary, and drainage was much better than usual for a winter month. For this reason the night freezes had little effect in lifting the roots of wheat and grass out of the ground. Although the freezes of the last few days probably caused some injury, following as they did a period of growth, the condition of the wheat crop as a whole remained fair to good, and generally rather better than anticipated earlier in the winter. The comparative dryness of the soil led to excellent progress in breaking of sod land and other early plowing. Many tobacco plantbeds, estimated at more than one-half of the total number required, were sown near the middle of the month. Heavy rains about the 22d stopped outdoor work, and the severe cold that followed prevented further progress. Conditions were especially favorable for young lambs, hence the usual large losses from inclement weather were not sustained this year. Except that lack of moisture kept tobacco out of condition much of the time, the weather was suitable for stripping, which was about completed; and also for marketing, which was aided greatly by the improvement in dirt roads.

TEMPERATURE.

The average temperature for the month, based on reports from 43 stations, was 44.0°, which is 8.0 above normal. Except in 1890, this is the highest average temperature for February since State records were established. With the exception of two or three days, temperatures above normal prevailed from the 1st to 25th. In the periods 5-10th and 20th-23d, the excess ranged from 10° to 30°, and maxima of 60° to 75° were registered in all districts. In the short periods of sub-normal temperature, 11-12th and 26-28th, minima ranged from 10° to 20°. Extremes for the State were 76° at Farmers and Franklin on the 8th, and at Princeton on the 7th, and 8° at Junction City on the 12th and 28th.

PRECIPITATION.

The average precipitation, 71 stations reporting, was 3.91 inches, which is 0.38 inch above normal. Moderate to heavy rain occurred in the periods, 1st-2d and 21st-25th; and light showers on the 9th and 15th. Snow, ranging from flurries in the western counties to 2.0 inches in a part of the bluegrass region, fell on the 11th. In most of the mountain region, the eastern bluegrass, and near the Ohio River, the monthly precipitation ranged between 2.0 and 3.5 inches. Near the southern border and in a broad strip extending from the lower Licking Valley to the southwestern counties, it varied between 4.0 and 6.5 inches. Extremes for the State were 6.61 inches at

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
§Lone Oak.
Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc.
† Also on other dates. †† Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.
¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

Greenville and Hopkinsville, and 1.93 inches at Oliver. Thunderstorms were reported on the 1st, 5th, 8th, 10th, 14th, 15th, 20th, 21st, 22d, and 23d.

MISCELLANEOUS.

Rivers:—The Ohio rose moderately from the 2d to 6th, and again to considerably higher stages from the 12th to 20th. Flood stages were approached in the section between Cloverport

Daily Precipitation for February, 1925

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C)Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

and Evansville. Heavy rains in the southeastern mountain region on the 15th caused a sharp freshet in the headwaters of the Kentucky River. Flood stage was nearly reached at Beattyville on the 16th. Flood stages were slightly exceeded in the upper Green from the 24th to 28th.

Daily Temperatures for February, 1925.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., MARCH, 1925. No. 3

GENERAL SUMMARY.

The month opened with a brief period of severe weather, otherwise moderate to unseasonably high temperatures prevailed. Warm weather in the second week caused speedy resumption of growth in grass and winter grains. Plums bloomed during this period, and were somewhat damaged by freezes later on near the middle and close of the month. Frequent frosts and occasional light freezes in the second and third decades retarded other fruit. Peaches bloomed during the last week, and were later subjected to freezing temperatures; but they did not suffer serious injury from these conditions. It was noted, however, that in the northern counties most varieties of peaches blossomed rather scantily, which indicated considerable winter killing of buds.

With the exception of a few days following the heavy rains near the middle of the month, hillsides and well drained uplands continued in good working order. Also, there were few days on which outdoor work could not be comfortably performed. In consequence, plowing, gardening, and potato planting advanced rapidly; and farm work in general was soon considerably ahead of the seasonal schedule. Progress was not so good on the clay lowlands of the western counties, which received more rain. Market gardeners had transplanted cabbage and had seeded extensively before the middle of the month. Early vegetables came up during the last week. While the high day temperatures and abundant sunshine stimulated wheat to grow more rapidly than desirable, the night frosts had a tendency to hold the development within seasonal limits. Most early wheat looked well, showing little evidence of winter injury; but the late sown ranged in condition from poor to fair, and the stand appeared very irregular. As a whole the crop exhibited unusual divergence in condition between early and late sowings. Pastures reached the grazing stage on warm slopes and uplands. Sowing tobacco plantbeds was completed during the third week without interruption of consequence.

TEMPERATURE.

The average temperature for the month, based on reports from 43 stations, was 49.2°, which is 2.8° above normal. On the 2d and 3d minima ranged between 5° and 15° at most stations in the central and northern counties. After the 6th mild temperatures, with high maxima during long periods, predominated. Extremes for the State were 84° at several stations on the 8th and 9th, and 4° at Farmers on the 3d.

PRECIPITATION.

The average precipitation, 77 stations reporting, was 3.59 inches, which is 1.25 inches less than normal. Light snow, ranging from a trace to 1.5 inches, occurred generally over the State on the 1st and 3d. There were moderate to heavy showers in the periods 11-14th, 17th-20th, and 25-27th. In a broad belt extending from the lower Big Sandy to the Purchase, monthly amounts ranged from 3.5 to 4.5 inches. Along the Ohio River and near the southern boundary they varied between 2.50 and 3.50 inches. Extremes for the State were 1.90 inches at Franklin and 6.19 inches at Bowling Green. Thundershowers occurred on the 10th, 11th, 13th, 14th, 18th, 19th, 26th, and 27th. Hail was reported from many localities on the 18th, from Louisville on the 13th, and from Junction City on the 27th.

MISCELLANEOUS.

March 18.—A series of local storms, mainly tornadoes, killed 18 persons, injured about 200, and caused damage estimated at more than $1,000,000. There were three well defined paths of tornadic action in this State. One entered Kentucky from Harrison County, Indiana, passed through Jefferson County, and ended in Oldham County. Its path in both States was about 40 miles long, and varied in width from about one-half mile on the knob highland of Indiana to 50 feet where it disappeared near Pewee Valley.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.

+ Also on other dates. ** Received too late to be included in means and summaries.

¶ Post-office addresses. Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

§ Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

In Kentucky this storm killed three persons, injured about 50, and caused damage estimated at $100,000. In Indiana it killed three persons outright, one died later, five were dangerously injured and 50 others less seriously hurt; while the property damage was estimated at about $100,000. For a storm of this character and severity, the damage was comparatively light because it passed through a farming section. A second tornado, with a path about 60 miles long and 200 to 400 yards wide, moved from Marion County through Washington, Mercer, Jessamine, and Fayette, to Bourbon County. It killed two persons, injured about 40, and caused property damage estimated at $850,000.

Daily Precipitation for March, 1925

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

The greatest damage occurred in Washington and Mercer counties. A third tornado entered the State from Tennessee, passed through Allen, Monroe, and Metcalfe, to Adair County. Its path in Kentucky was about 50 miles long, and where the funnel touched the earth about 500 feet to one-half mile wide. This storm killed 12 persons, injured about 60, and caused damage estimated at $100,000. These storms exhibited all the characteristics of tornadoes. In the early portions of their paths the destruction was almost continuous, but in the later stages of the storm the damage occurred in spots until the funnel cloud finally disappeared. One person was killed by lightning in Shelby County.

Rivers. Good stages prevailed in the Ohio during the month. The lower Green was in flood from the 1st to 4th, otherwise stages were moderate in the streams of the State.

Daily Temperatures for March, 1925.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., APRIL, 1925. No. 4

GENERAL SUMMARY.

Weather conditions exceptionally favorable for farm operations and growth of vegetation prevailed during the month. Not in many years have seasonal activities been so far advanced at the end of April. Temperatures averaged above normal almost continuously from the 2d to 26th, inclusive. Although precipitation was much less than normal, it occurred as frequent showers and was sufficient for the needs of wheat and rye. Young clover germinated poorly and pastures felt the need of more rain. There were no general frosts after the 1st, which was the last killing frost to reach all districts. The excellent start made in plowing and gardening during the preceding month continued without serious interruption until farm operations were from one to two weeks ahead of the season. Deficient moisture early in the month made it necessary to water tobacco plantbeds, but the showers and high temperature later on developed the plants more rapidly than usual. Wheat improved steadily, but the late sown was so thin on the ground that much of it was plowed up. Early wheat commenced to joint by the second week, and had reached a height of one and one-half to two feet at the close of the month. Late wheat improved decidedly by stooling. Early gardens developed so rapidly as to produce vegetables for the table. Potato planting was finished early in the month, and cultivation of the first plantings had commenced in the southern counties. Corn planting began in that section about the 10th, and was nearly half completed by the 30th. Cotton planting began about the 2d in the extreme southwest, and continued throughout the month. In that district cultivation of early corn and cotton commenced. Like other crops, oats advanced remarkably, with a good stand and large acreage. Early rye furnished abundant grazing and bluegrass grew luxuriantly. Except for peaches, which suffered from winter-killing in the northern counties, the prospect for tree fruits was generally good.

TEMPERATURE.

The average temperature for the month, based on reports from 40 stations, was 61.2°, which is 5.3° above normal and the highest on record for the State with the exception of April, 1896, when the average was 63.6°. Minimum temperatures near freezing occurred at many stations during the first week. From the 8th to 26th high maxima occurred nearly every day. They registered above 90° in all districts on the 23d and 24th. Extremes for the State were 98° on the 24th, and 23 on the 1st; both at Farmers.

PRECIPITATION.

The average precipitation for the State, 77 stations reporting, was 3.16 inches, which is 0.87 inch below normal. Most of it occurred as light to moderate showers, frequently with light hail, in the following periods: 3d-5th; 9-11th; 14th-22d, and 26-30th. There were only a few heavy local rains. In most of the bluegrass region and in the counties along the Ohio River, the monthly amounts ranged between 1.5 and 3.0 inches. In the south-central districts they varied between 4.0 and 6.0 inches. Extremes for the State were 1.24 inches at Grayson, Carter County, and 6.70 inches at Junction City. Thunderstorms were reported on the 9th, 10th, 13th, 14th, 16th, 17th, 18th, 19th, 20th, 21st, 22d, 26th, 27th, and 28th.

MISCELLANEOUS.

Hail: at Greensburg and Lexington on the 19th, damaged plantbeds; at Ballardsville on the 14th, damaged fruit; at Pembroke on the 9th, damaged skylights and roofs. Light hail was reported as follows: 9th, Hopkinsville; 10th, Taylorsville; 18th,

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, † represents two days, etc.

* Also on other dates. ** Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

¶ Post office addresses—Lock 2, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8 Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Earlington; 20th and 22d, St. John; 21st, Scott and Williamstown; 24th, Sergent; 25th, Hindman; 29th, Lexington and Greensburg.

Casualties by lightning: 9th, boy killed near Owensboro, while riding a mule; 14th, two men shocked by lightning near Lagrange; 21st, farmer probably fatally burned while in his barn near Lagrange.

Rivers:—Stages remained low in all streams of the State during the month.

Daily Precipitation for April, 1925

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

¶ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours.

*Separate dates of falls not recorded. T. Trace, or less than 0.01 inch. * Precipitation included in the next following measurement

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking, (K) Kentucky; (S) Salt; (G) Green (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak

Daily Temperatures for April, 1925.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
VOL. XXX LOUISVILLE, KY., MAY, 1925. No. 5.

GENERAL SUMMARY.

The month was cool, dry, and decidedly unfavorable for seeding and growth. Frost occurred in the western, central, and northern districts on the 25th and 26th, damaging tender vegetables such as beans, potatoes, and tomatoes, on low lands. In the extreme northern counties corn in creek and river bottoms was so seriously injured that much replanting was required. Precipitation was sufficient in most of the State during the first decade, but little rain occurred after the 11th. Marked deficiencies in precipitation in the northern and western counties, following shortages in preceding months, caused drought conditions to appear in those sections during the second decade. Corn planting advanced slowly because of the fear that the persistent cool weather and dry soil would largely prevent germination. As a rule the later plantings came up to poor stands. Early corn turned yellow and was much retarded in growth. Except in the drier districts planting was finished before the close of the month. Some early tobacco plants were transplanted during the first week, which is ten days or more before setting usually begins, and the work became general by the 15th. Dry weather during the last two weeks practically prevented setting in the hill districts; while the work advanced slowly by machine on the smooth land. Wheat fared better than other crops, and headed earlier than usual. Late wheat stooled generously and improved. Oats, affected by dry weather, showed indications of heading short. Clover bloomed low and seed bluegrass made poor growth, all crops of this character showing the increasing exhaustion of soil moisture. Pastures began to deteriorate during the last week. Cutting of the first crop of alfalfa began during the first week in the Purchase, and continued toward the north and east during the next three weeks. Gardens, although well started made poor progress, suffering worse than other vegetation from the extremes of temperature. Potatoes grew well, but reached a critical condition from lack of moisture. Cotton made slow progress, partly due to the cold and partly because of near-drought conditions in that district. Strawberries began to ripen about ten days earlier than last year, but the cool weather greatly reduced the crop.

TEMPERATURE.

The average temperature for the month, based on reports from 42 stations, was 61.2°, which is 4.4° below normal, and one of the lowest records for May. Minimum temperatures between 35° and 40° were registered at many stations in the periods 1st-8th and 25-27th. Except on a few days, maximum temperatures were moderate or low. Extremes for the State were 98° at Hopkinsville on the 31st, and 28° at Farmers on the 8th.

PRECIPITATION.

The average precipitation for the State, 76 stations reporting, was 2.61 inches, which is 1.36 inches less than normal. At many stations it was less than half of the normal amount. Rains, varying from light to heavy, occurred in the period 9-11th, and scattered showers in the periods 1st-6th and 16-17th. Snow flurries were reported from several central and northern stations on the 25th. In the southern bluegrass region, the upper Cumberland basin, and eastward, amounts for the month ranged between 3.0 and 4.9 inches; but they diminished north and west to little more than 1.0 inch near the Ohio and Mississippi rivers. Extremes for the State were 4.95 inches at Ravenna and 0.77 inch at Earlington. Thunderstorms were reported on the 3d, 4th, 9th, 16th, 17th, 21st, 24th, and 31st.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. [a]Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.
* Also on other dates. †† Received too late to be included in means and summaries T. Precipitation is less than 0.01 inch rain or melted snow.
[c]Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS.

Hail: light at Berea on the 4th; Louisville, 16th; Hindman, 25th; heavy, near Flemingsburg, 24th.

Lightning losses: May 16.—Two barns burned near Lexington, and three valuable colts lost

Storm damage: May 24.—In Fleming County, in a strip about half a mile wide and three miles long; probably a squall; about 40 barns destroyed; crops and gardens totally destroyed by hail.

Rivers.—Low stages prevailed during the month.

Daily Precipitation for May, 1925

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak. § Precipitation measured at 7 a. m. beginning April 16th.

Daily Temperatures for May, 1925.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., JUNE, 1925. No. 6.

GENERAL SUMMARY.

Drought prevailed in the eastern counties during the first three weeks, becoming most severe in the northern bluegrass region. Good showers in the central counties during the first week gave local relief. Heavy rains in the western districts in the second week, extending eastward over the Green River Valley, ended the drought in those sections. Rains finally reached the northeastern counties in the last week. Wheat was least affected by the drought, but ripening was accelerated. Harvest began near the south border about the 12th, followed ten days later by threshing. Yields were somewhat better than anticipated. The growth of corn was much retarded in the eastern counties where the drought persisted longest. While waiting for rain it developed large root systems, hence very rapid growth followed the arrival of sufficient moisture. At the end of the month early corn had been laid by in the western counties, but the drought had prevented it from reaching this stage in the bluegrass region. Tobacco setting was so seriously affected by the dry weather that only about three-fourths of the usual crop was put out. In the hill section of the northeastern counties, only one-third of a crop had been set by the 20th, which is generally regarded as the late limit for setting. With moderate temperature a favorable feature, considerable tobacco was set in that section after the rains in the last week. During the long drought much early tobacco died and could not be replanted, causing decided irregularity in that part of the crop. Machine set plants most successfully withstood the dry weather. The crop as a whole was much behind its usual condition at this time in the season. Both corn and tobacco were well cultivated and remarkably clean. The bluegrass seed crop was the lightest in years; while pastures, clover, alfalfa, and timothy meadows also gave light yields. These crops were affected by a marked shortage in subsoil moisture, that resulted from four consecutive months with deficient precipitation. Early potatoes ranged from poor to fair, averaging about half of a crop. Oats headed so short that most of them had to be mowed. Gardens were the poorest in years, raspberries dried up, blackberries were damaged, and even cherries were affected. Cotton made good progress, the rains reaching that district in time.

TEMPERATURE.

The average temperature for the month, 41 stations reporting, was 77.0°, which is 3.1° above normal. Temperatures averaged continuously above normal, and high maxima were the rule during the first three weeks; but the month closed with a few days of moderately cool weather. Extremes for the State were 105° at Greenville on the 4th, the highest for June since 1914; and 48° at Farmers on the 11th.

PRECIPITATION.

The average precipitation for the State, obtained from the records of 76 stations, was 3.90 inches, which is 0.19 inch less than normal. In the middle and eastern divisions, most of the rain fell from the 22d to 25th. There were also heavy rains in the western counties on the 13th. Showers, extremely local and badly distributed, occurred in the periods 6-9th, 13-19th, and 28-30th. Monthly amounts varied between 1.67 inches at Wayland and 7.58 inches at Munfordville. As usual with such distribution, differences between adjoining counties frequently amounted to 3.0 inches or more. In the Green River basin and the Purchase, there were limited areas that received 5.0 to 7.0 inches. In the extreme northern bluegrass, the mountain region, and the area between the Green and the Cumberland,

All temperature data are taken from self-registering thermometers.
Precipitation from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published in determining section or division means.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published in determining section or division means. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, a, k, etc., appearing in the table indicate number of days missing; for example, b represents two days, etc.
*Also on other dates. †Received too late to be included in means and summaries. ‡Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.
¶Post-office addresses: —Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

amounts ranged between 2.0 and 4.0 inches. Thunderstorms were reported on most days from the 6th to 29th, frequently attended by excessive downpours but with little damage. At Blandville 4.43 inches occurred on the 13th in 6 hours and 10 minutes

MISCELLANEOUS.

Hail: light at Lexington, 6th; moderate to heavy near Lexington, 24th; heavy near Covington, 29th, glass in greenhouses broken.

Rivers.—Low stages prevailed during the month.

Daily Precipitation for June, 1925

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

§ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

§ Precipitation measured at 7 a. m. beginning April 16th.

Daily Temperatures for June, 1925.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., JULY, 1925. No. 7.

GENERAL SUMMARY.

The weather continued decidedly warm during the first half of the month, but was generally quite cool through the last half the month ending with temperatures far below normal and somewhat unfavorable for late corn Although irregular in distribution, precipitation averaged near normal and was sufficient for the needs of the staple crops in most districts. Further heavy rains in the northeastern counties during the first week restored satisfactory growing conditions. In other sections the rainfall prior to the 20th was exceedingly local, resulting in a variable crop situation. Some localities received sufficient rain, while in others near-drought conditions prevailed much of the time. Except the lower Green River valley, which remained dry, the general rains of the 20th relieved the local drought. Corn recovered rapidly in the eastern counties and, except on hills and thin uplands, continued good to excellent in other districts. The rains came soon enough to prevent premature tasseling, while the moderate temperature of the last decade favored fertilization. Late settings of tobacco suffered from the intense heat and dryness of the first week, which affected the stand and retarded the growth. The uneven character of the early settings, due to the unfavorable season for transplanting, persisted until topping, which proceeded irregularly as plants reached the proper stage. Pastures, timothy, and alfalfa gave light yields, being affected by the lack of subsoil moisture that had prevailed during the entire growing season. At some stations, precipitation for the previous six months was the lightest on record. Conditions were generally favorable for threshing and hay harvest. In the extreme northern counties, hay was discolored and some grain was spoiled in shocks because of soaking rains. Soil and temperature conditions generally favored late potato planting. Cowpeas and soybeans made good growth even in the drier districts. Cotton developed rapidly, keeping about two weeks ahead of seasonal expectations.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 76.7,° which is 0.2° below normal. Temperatures were above normal from the 2d to 16th, and generally below during the remainder of the month Maxima above 100° occurred at many stations in the period 2d-4th, and minima of 50° or lower on the 29th and 30th. Extremes for the State were 105° at Earlington and Hopkinsville on the 2d; and 46° at Farmers, Eubank, and Junction City on the 29th.

PRECIPITATION.

The average precipitation obtained from the records of 81 stations, was 3.93 inches, which is 0.24 inch less than normal. Moderate to heavy rains occurred generally in the period 21st-22d, otherwise precipitation was entirely local in character. Rain was reported on every day in the month except two. The distribution over the State was exceptionally irregular. In the district north of the parallel of Lexington amounts ranged between 4.0 and 9.0 inches. They diminished rapidly southward, ranging from 1.0 to 3.5 inches in most of the south-central and west-central counties. A limited area in the western division received from 4.0 to 5.5 inches. Monthly amounts ranged between 0.68 inch at Woodbury, in the Green River valley, and 9.21 inches at Gest, Henry County. Thunderstorms were reported on 19 days, attended frequently by wind squalls and destructive lightning.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published in the miscellaneous section of division reports.
Kanawha, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
In determining means, b represents two days, etc.
Temperature values, * * *, appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.
† Also on other dates. ** Received too late to be included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow.
‡ Post office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

MISCELLANEOUS.

Damage by wind and lightning: 2d, at Covington; 3d, at many places in the bluegrass region; 4th at Horse Cave and Russellville; 25th, to roofs, timber, and wire systems in Jefferson and Henry counties.

Lightning casualties: 3d, two men were severely shocked near Versailles while in a barn; 10th, near Lewisport a farmer killed while in the open field; 14th, railroad workman killed near Jackson's Chapel, Hickman County; 16th, in the driveway of a barn near Berea two boys killed and two men badly shocked

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak. § Precipitation measured at 7 a. m. beginning April 16th.

—near Crofton, man killed while standing under a tree, 25th, the driver of a wagon killed near Owensboro.

Rivers:—Stages remained low in all streams of the State

Daily Temperatures for July, 1925.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., AUGUST, 1925. No. 8.

GENERAL SUMMARY.

In the northern bluegrass region sufficient rain occurred to mature the crops, but in the remainder of the State precipitation ranged from practically nothing to about one-third of the normal amount. Drought became well established in large areas during the first decade, seriously affecting corn and tobacco on hills and uplands. Showers, varying greatly in amount, brought temporary local relief in the eastern and southern counties in the second decade. The deficiency in subsoil moisture, resulting from several months of light rainfall, together with the prevailing high temperature, caused the areas of drought to expand until all central, southern, and western districts were more or less seriously affected. Except on thin soils and warm slopes, early corn matured a good crop. It dried so rapidly that cutting became necessary in the last week. Late corn was injured generally, and much of it on the thinner soils was ruined, by the intensifying of drought during its silking and tasseling period. Even on bottom lands and the good soils of the southern bluegrass region the crop "fired" and many stalks set no ears. Early tobacco matured well in the northern burley district, and fairly well elsewhere. Cutting, induced by premature ripening, commenced about the middle of the month and proceeded in somewhat irregular fashion as farmers were forced by progressive "firing" to cut the more mature portions of the crop. Later settings failed to spread properly, and much of the last setting never became large enough to top. Conditions were ideal for air curing tobacco in barns, but the intense heat of the sun caused it to sunburn in fields soon after cutting. Late potatoes made such poor progress as to be in practically hopeless condition by the end of the month. Cowpeas and soybeans had to be harvested sooner than usual. The quality of hay was excellent, but the yield was lighter than expected. Pastures deteriorated rapidly until practically dried up. The third crop of alfalfa was light, and there was little prospect for a fourth crop. Tomatoes for canning, after an exceptionally short ripening season, began to fail. Cotton bolls were opening generally by the end of the month, and growth of foliage had ceased in many fields. Some fall plowing was done, but this work had to be abandoned later. Water for stock and domestic purposes became so scarce as to cause much inconvenience and suffering.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 76.5°, which is 0.9° above normal. There were two periods of cool weather, 1st-5th and 21st-23d; otherwise temperatures averaged generally above normal. Maxima of 100° or higher occurred in the central and western counties from the 17th to 20th, and in the western counties on the last five days. Extremes for the month were 106° at Earlington on the 19th and 44° at Farmers on the 26th.

PRECIPITATION.

The average precipitation based on the reports of 79 stations, was 1.47 inches, which is 2.24 inches less than normal. Except in 1889, this is the lowest average rainfall for August since State records were established. The last decade was nearly rainless. Light, local showers occurred in the periods 2d-4th; 7-9th; 11-14th, and 18th-21st. There were no general rains. Except in a limited district in the northern bluegrass region, where from 2.00 to 5.00 inches occurred, the monthly precipitation ranged generally from 0.5 to 1.5 inches, and diminished toward the south and west. A trace at Marion was the lightest

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record; but all complete reports are used in determining section or division means.
‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. † Received too late to be included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.
¶Post-office addresses—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

and 5.17 inches at Carrollton the heaviest monthly amounts reported. Thunderstorms occurred on 14 days, mainly in the first two decades.

MISCELLANEOUS.

Damage by wind: 19th, to trees, wire systems, and windows in Louisville and Jefferson County.

Hail: 3d, destroyed about 300 acres of tobacco and damaged

Daily Precipitation for August, 1925

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak. §Precipitation measured at 7 a. m. beginning April 16th.

corn in the same area to the extent of more than half of the crop, in Clark, Fayette, and Bourbon Counties, estimated loss $125,000; 5th, damaged crops in the vicinity of Williamstown, 21st, damaged about 450 acres of tobacco to the extent of 25 per cent around Hopkinsville, estimated loss $25,000; 25th, tobacco destroyed and corn damaged near Columbia, loss probably $5,000.

Rivers:—All streams remained low. Some tributaries of the Licking, Big Sandy, Kentucky, and Cumberland, in the eastern Kentucky mountains reached the lowest stages ever recorded.

Daily Temperatures for August, 1925.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., SEPTEMBER, 1925. No. 9.

GENERAL SUMMARY.

Decidedly warm weather prevailed during most of the month, and in the first decade drought conditions became much worse. For the first twenty days the temperature averaged practically the same as in very warm Julys, and exceeded any previous records for this period in September. The intense heat and persistent drought caused further deterioration in late crops, prevented fall plowing and seeding, and greatly increased the hardships and suffering incident to the shortage of water. Heavy rains reached some localities in the western counties near the middle of the month, but precipitation was light to moderate in other sections. Rains that occurred later in the month were also much heavier in the northern and western districts, diminishing in amount toward the south and east. The showers temporarily relieved the water shortage and softened the soil enough to permit of the resumption of plowing. Rapid evaporation, induced by the intense heat, minimized the effect of the rains and kept the soil too dry to pulverize into a satisfactory seed bed. During the last two weeks moisture gradually accumulated in the upper layers, and finally became sufficient to bring up the rye that had been sown for pasture and cover crops. Late corn was already badly "fired" or had failed to fertilize on account of the drought, hence it was not benefited to any extent. Late tobacco "fired" to the top of the plants and farmers, despairing of further growth, cut most of it in this undeveloped condition. Tobacco remaining in the field was too small and green to offer hope of any yield of consequence. Some of the earliest fields of late potatoes were helped by the rains, but most of the crop had been so stunted by the drought as to be hopelessly late. In general alfalfa failed to make a fourth crop. The barren pastures rendered feeding necessary throughout the month, much of the late corn that could not be utilized in silos being used for that purpose. In limited areas near the Mississippi and lower Ohio rivers, small streams began to flow; but in other districts the usual sources of stock water were not replenished. The ripening of cotton was so hastened by the heat that picking was well under way by the end of the month.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 77.2°; which is 6.9° above normal, and by a considerable margin the highest on record for this month. It is noteworthy that this average is slightly higher than the normal mean temperature in this State for July. From the 1st to 13th maximum temperatures ranged between 90° and 110°; while in the period of greatest heat, from the 3d to 9th, maxima of 100° or higher were recorded daily at most stations. Some stations also reported 100° or higher on the 18th and 19th. With the exception of a few days in the last decade, temperatures averaged continuously above normal. The highest reported was 110° at Beaver Dam on the 6th, and the lowest 45° at Farmers on the 30th.

PRECIPITATION.

The average precipitation, 2.83 inches, as determined from the reports of 80 stations, is practically normal; but poorly represents the marked irregularity in areal distribution. In the eastern counties, monthly amounts ranged between 1.0 and 2.0 inches at most stations, and in much of the central district they were only slightly higher. The extreme western counties received from 4.0 to 6.0 inches, the heaviest rains occurring near the Mississippi and lower Ohio rivers. Rain occurred

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

§Lone Oak.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Precipitation is less than 0.01 inch rain or melted snow.

† Also on other dates. †† Received too late to be included in means and summaries.

a Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

generally from the 12th to 16th but varied greatly in local distribution. There was also considerable rain in the western counties on the 21st, 22d and 27th, but only light to moderate showers in the central and eastern districts. The heaviest for the month was 6.36 inches at Owensboro, and the lightest 0.70 inch at Sergent. Thunderstorms were reported on 12 days, mostly in the periods of intense heat.

Daily Precipitation for September, 1925

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

§ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch. * Precipitation included in the next following measurement.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak. § Precipitation measured at 7 a. m. from April 16th to Sept. 15th.

MISCELLANEOUS.

Hail and wind: 9th, tobacco badly damaged in southwestern rt of Christian County in a strip three miles wide and several les long.

Rivers:—All streams continued very low. The small streams in central and eastern districts were generally dry.

Daily Temperatures for September, 1925.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., OCTOBER, 1925. No. 10.

GENERAL SUMMARY.

In striking contrast to conditions prevailing during the preceding month, the weather was exceptionally cold, cloudy, windy, and unfavorable for farm work. There were but few days when outdoor work could be comfortably performed. Good showers during the first decade were beneficial in replenishing the streams, but the heavy precipitation that followed kept the soil saturated and interfered greatly with plowing and seeding. Wheat sowing commenced during the first week, and continued fitfully between rains until late in the month. In the western counties the work could not be completed, some localities reporting that only one-half of the intended acreage had been sown. Better results were obtained in the southern and eastern counties. Wheat sown early in the month came up to a good stand, but grew slowly on account of the low temperature. Hard freezes from the 28th to 31st, with considerable snow and average temperatures about 20° below normal, rendered the plants almost as dormant as in winter. Rye for pasture, which was mostly sown in September, made good growth and soon reached a size appropriate for grazing. Not much use could be made of it, however, because of the muddy state of the fields. Some very green and much belated tobacco remained in the fields until after the middle of the month, but the low temperature and general dearth of sunshine, rendered maturity impossible, while persistent rains prevented cutting and housing in anything like satisfactory condition. Tobacco housed during the previous month had cured so well that it was not adversely affected by the wet weather. Corn molded to a considerable extent in the water-soaked shocks, and standing corn fell in the muddy fields under the influence of the windy beating rains. Progress with gathering was exceedingly slow. Until the killing frost of the 20th, late potatoes grew slowly because of the cold and lack of sunshine. The crop in general had been so delayed and injured by the previous drought that tubers of good size could not develop. Bluegrass pastures revived as in spring, the grazing furnished largely relieving the necessity for feeding. Alfalfa and clovers also revived, but showed in spotted stands the effects of the long drought.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 52.9°, which is 5.2° below normal and among the lowest on record. Except for a few days at the beginning and near the middle of the month, mean temperatures were continuously below normal, daily deficiencies during nearly half of the month ranging from 10° to 20°. In the period 28th-31st minimum temperatures ranged between 16° and 28° at most stations. The extremes were 88° on the 4th at Dix Dam, and 13° on the 29th at Farmers.

PRECIPITATION.

The average precipitation for the State, based on reports from 79 stations, was 7.09 inches, which is 4.49 inches above normal, and exceeded only for this month by the record average of 7.99 inches in October, 1919. In the northeastern counties, including the northern bluegrass region, amounts at the various stations ranged between 4.0 and 6.5 inches. They increased toward the southwestern districts, where the range was between 7.0 and 11.5 inches. In the central sections from 7.0 to 9.0 inches occurred, diminishing somewhat toward the southern border. The total snowfall, which was unprecedented for October, varied generally between 3.0 and 6.5 inches in the northern half of the State and from 1.0 to 3.0 inches in the southern counties. Precipitation in measurable amount was

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Hunsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

§Lone Oak.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. ** Received too late to be included in means and summaries.

¶ Post-office addresses: – Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Lock 10, Scott, Covington, Ky.

T. Precipitation is less than 0.01 inch rain or melted snow.

reported on every day in the month. The first 17 days practically constitute a single rain period, with the heaviest precipitation during the 1st-2d and 12-17th. The 22d, 24-25th, and 28-30th were also periods of general precipitation. Amounts varied between 3.87 inches at Grant (Dam 38, Ohio River) and 11.50 inches at Lone Oak, near Paducah. Thunderstorms were reported on the 4th, 16th, 17th, 23d, and 24th.

Daily Precipitation for October, 1925

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland Tennessee; (O) Ohio; (M) Mississippi. ¶Lone Oak.

MISCELLANEOUS.

Oct. 16: Tornadic conditions, evidently belonging to the same storm, prevailed g a narrow path about 160 miles in length, extending from Warren to Estill County. ornado touched at widely separated intervals in a path 150 yards to one-fourth wide. The heaviest damage was in Warren, Hart and Marion counties. One person was killed, 11 seriously injured, and 33 received minor injuries. The damage was estimated at $250,000.

Another tornado struck Alloway, a mining camp in Perry County, killing one person, injuring nine, and causing damage estimated at $5,000.

Rivers: Small streams started generally during the second week, and the flow increased gradually to moderate stages by the end of the month.

Daily Temperatures for October, 1925.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
VOL. XXX LOUISVILLE, KY., NOVEMBER, 1925. No. 11.

GENERAL SUMMARY.

Temperature conditions were variable, but unseasonably cold weather predominated. Precipitation averaged considerably above normal, and its frequency interfered greatly with farm work. In the first two weeks corn could be gathered only on occasional days, and molding in damp shocks continued. In a period of fair weather of about ten days duration, following the 15th, this work advanced at a fairly satisfactory rate; but fields remained so soft that they could scarcely be traversed with full loads. Fodder became so blackened and decayed as to seriously impair its feeding value. The same conditions that hindered the gathering of corn also hampered the picking of cotton. The damp weather kept tobacco in stripping order most of the time, which made it possible to strip at times when outdoor work could not be carried on. Progress with this work was therefore somewhat better than usual in November. Because the weather prevented the completion of seeding in October preceding, some wheat was sown during the first week. On account of persistent rains wheat sowing could not be finished. Wheat grew slowly during the short periods of warm weather, but temperatures frequently below freezing and lack of sunshine checked its development and rendered it practically dormant. Although the plants were generally small, they appeared to be well rooted and vigorous. Germination was good and satisfactory stands resulted, even in the latest sown. Rye and grass pastures continued fairly good during the first three weeks, only moderate feeding being required to supplement the grazing furnished. Stock continued to improve in condition. Dirt roads softened as in winter, and work on highways was seriously handicapped by rain and mud.

TEMPERATURE.

The average temperature for the State, 44 stations reporting, was 44.9°, which is 1.4° below normal. Short periods of moderate temperature alternated with cold spells when daily means ranged from 8° to 15° below normal. Maximum temperatures were generally low, and minimum temperatures below freezing were registered on most days after the first week. The highest for the State was 73° at Greensburg on the 7th, and at Franklin and Hopkinsville on the 14th. The lowest was 8° at Farmers on the 24th.

PRECIPITATION.

The average precipitation for the State, determined from the reports of 80 stations, was 5.13 inches, which is 1.60 inches in excess of normal. Its areal distribution was fairly uniform. In the northern and eastern counties monthly amounts ranged between 4.0 and 5.5 inches at most stations, and were generally largest in the bluegrass region. Precipitation was somewhat heavier in the south-central and western counties, varying generally between 5.0 and 7.0 inches. From 0.5 to 2.0 inches of snow occurred in the bluegrass section, but snowfall diminished to mere flurries toward the south and east. Moderate to heavy rains occurred in the periods 5-8th, 12-13th, and 26-27th; and there were showers ending with snow in the period 15-16th. Amounts for the State varied between 3.34 inches at Pikeville and 7.42 inches at Mt. Sterling. Thunderstorms were reported on the 7th and 26th.

MISCELLANEOUS.

Rivers:—Heavy rains caused a sharp rise in the Ohio to moderately high stages between the 8th and 18th. A moderate freshet occurred in the upper Green on the 29th.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [a] represents two days, etc.

T. Precipitation is less than 0.01 inch rain or melted snow.

§Lone Oak.

[a] Also on other dates. †Received too late to be included in means and summaries.

[b] Post-office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

§ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking: (K) Kentucky: (S) Salt: (G) Green: (C) Cumberland (T) Tennessee: (O) Ohio: (M) Mississippi.

¶ Lone Oak.

Daily Temperatures for November, 1925.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXX LOUISVILLE, KY., DECEMBER, 1925. No. 12

GENERAL SUMMARY.

There were marked and rather frequent variations in temperature, but in general the first half of the month was mild and the last half decidedly cold. Wheat and rye, which were dormant at the beginning of the month, made some growth under the influence of the warm weather and sunshine of the second week. Pastures of rye and grass continued to furnish a fair amount of grazing through this period, so that stock required only moderate feeding and fared well out of doors. Temperatures far below normal prevailed during the last decade. A severe cold wave that spread over the State on the 25th caused temperatures to fall below zero and to continue low until the close of the month. In the absence of snow cover through this period of severe weather, wheat suffered some injury from the lifting effect of the deep freezes; but on account of the relative dryness of the soil, the damage was not believed to be of consequence. Rain in the first week interfered with outdoor work; but the dry weather and moderate temperature in the decade that followed, caused corn gathering to be pushed to completion on most farms. Tobacco stripping proceeded during the first week, but after that the weather was too dry and the weed was generally out of condition. The continuous dry weather, as well as the steady improvement in the condition of roads, facilitated the movement of tobacco to local markets. The month was the driest December of record. In more than half of the area of the State the precipitation amounted to less than 1.00 inch. Notwithstanding the heavy rainfall of the two preceding months, streams failed to maintain the usual winter stage and froze over quickly in the period of low temperature.

TEMPERATURE.

The average temperature for the State, 43 stations reporting, was 34.8°, which is 2.8° below normal. Temperatures continuously above normal, with a few decidedly warm days, prevailed from the 7th to 15th; and below normal, with average daily deficiencies between 15° and 30° on several days, during the last decade. On the 27th temperatures below zero were reported from most stations, and also from many stations on the 28th. The highest for the State was 70° at Sergent on the 4th, and the lowest —5° at Williamstown on the 27th.

PRECIPITATION.

The average precipitation for the State, based on reports from 77 stations, was 0.89 inch, which is 3.19 inches less than normal, and the lightest on record for December. In the northeastern and most of the central section, amounts ranged from 0.40 inch to 1.00 inch; while in the southwestern and southeastern counties they varied between 1.00 and 2.00 inches. General rains occurred in the period 4-6th, and scattered showers from the 14th to 16th. Snow, ranging in amount from 0.5 inch in the south-central counties to 3.0 inches in the central districts, occurred from the 21st to 26th. The total precipitation varied between 0.25 inch at Ravenna, and 1.94 inches at Hopkinsville and St. John. Thunderstorms were reported from a few stations on the 4th.

MISCELLANEOUS.

Dec 4.—A storm or series of storms, exhibiting tornadic characteristics at intervals along the path, occurred in Calloway, Marshall, Livingston, Lyon, and Caldwell counties. Paths of destruction ranged from 50 yards to 3-4 mile in width. Extensive damage was caused at Murray, Kuttawa, and Princeton. Near Glade, Marshall County, two persons were killed by the

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, 1 represents two days, etc.

* Also on other dates. ** Received too late to be included in means and summaries.

¶ Post-office addresses: ‡Lock 6, Versailles, Ky.; §Lone Oak. Lock 5, Lawrenceburg, Ky.; Lock 6, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, 1 represents two days, etc.

T Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

* Also on other dates. ** Received too late to be included in means and summaries.

¶ Post-office addresses: ‡Lock 6, Versailles, Ky.; Lock 5, Lawrenceburg, Ky.; Lock 6, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Covington, Ky.

wrecking of their home. The total property loss from these storms was estimated at $75,000.

Rivers:—At the beginning of the month good stages prevailed in the Ohio River, but they declined to pool stage by the 21st. In this condition the river soon filled with ice on the advent of the cold spell that began on the 26th. Navigation was suspended by the 27th, and the river was frozen across in places on the 28th.
